Sweden. Sweden has for a naval ensign a blue flag upon which is a yellow cross. The flag is swallow-tailed, and the horizontal arm of the cross in the fly projects. The merchant flag is the same as the ensign with the exception of the swallowtail, the merchant flag being rectangular.

Switzerland. The flag of Switzerland is red with a white cross upon its centre. The arms of the cross do not extend to the outer edges of the flag. The national and merchant flags are one and the same. In 1863 an international conference was held at Geneva, in which the rules of war were discussed and field and permanent hospitals, ambulance service, and the many humane methods of caring for the wounded were officially recognized by the signatory powers. A badge was devised as the distinguishing mark of this work. It was the flag of Switzerland with the colors counterchanged, making it a red cross on a white ground.

Turkey. The naval and merchant flags of Turkey are alike and are light red, on which are superimposed a crescent and a star in silver. The crescent moon is near the flagstaff and the star remote from it. The crescent was made the emblem of Byzantium after the siege of that city by Philip, father of Alexander the Great. A night attempt by the followers of Philip to undermine the walls of the city was revealed by the light of the crescent moon. In gratitude for this delivery Diana's symbol became the badge of the city. In 1453 Mahomet II captured the city and adopted the badge for the Ottoman Empire.

ASIA

China. Since China became a republic, in 1912, the flags formerly used have been discarded. The national flag, used also in the merchant service, consists of five broad horizon-

tal bands of color, the uppermost, red, standing for China proper, the next, yellow, for Manchuria; the next, blue, for Mongolia; beneath that is white, for Tibet, and lowest of all is black, for Turkestan. The flag of the navy is red with a blue canton in the upper corner next the hoist, and upon this is a large white sun, from which emanate rays in the form of small triangles. The colors thus employed in the naval flag stand for Mongolia, Tibet, and China proper.

Federated Malay States. The Federated Malay States (Pahang, Perak, Negri Sembilan, and Selangor) have a flag of four horizontal bands of color. Beginning at the top they are white, red, yellow, and black. In the centre of the flag is a horizontal oval of white, on which a tiger is shown in its natural colors on a green grass ground.

Japan. The flag of the Mikado of Japan, which corresponds to the royal standard of European countries, is a red rectangular flag upon which appears in the centre a golden conventional representation of the yellow chrysanthemum. The naval flag is white, with a red disk, representing the sun, placed slightly out of the centre and nearer the flagstaff. From this disk broad fan-shaped bands of red color radiate like the rays of the rising sun. The flag of the merchant marine is white with a red circle in the centre. The present flags were adopted in 1897.

Persia. The Imperial standard of Persia is a blue flag with a white circle in the centre, on which appear the arms of Persia. The military flag, there being no naval ensign, is a horizontal tricolor—green above, white central, and red below. Upon the centre of this flag are the arms of Persia, similar to those on the Imperial standard, but not inclosed in a white circle.

Siam. The standard of Siam is a red flag upon which appear the royal device, a white elephant with trappings and harness, standing on a platform, and in the upper corner next the hoist an anchor and a wheel. The merchant flag has the white elephant only, without trappings or platform, and without wheel and anchor. The origin of this white elephant is said to be that before Xacea, the founder of Siam, was born his mother dreamed that she brought forth a white elephant, and the Brahmans said that after many incarnations Xacea became a white elephant and was received among the celestial deities.

AFRICA

Abyssinia. The national ensign is the tricolor, the colors from the top being green, yellow, red, without any device.

Belgian Congo. Belgian Congo has a blue flag carrying in the centre a five-rayed golden star and showing the Belgian ensign in the canton.

Liberia. The national ensign has 11 horizontal stripes, red and white, with a large white star in a blue canton next the flagstaff in the upper corner. The naval and merchant flags are alike.

SOUTH AND CENTRAL AMERICA

Argentina. The flag of Argentina has three bands placed horizontally. At the top is blue, centre white, bottom blue. For the naval flag the sun in splendor is shown on the central white band.

Bolivia. Bolivia has a tricolor with horizontal stripes. Red is uppermost, yellow in the middle, and green below. For the naval flag the arms of the state are introduced in the centre of the yellow stripe, while the merchant flag is plain.

Brazil. Brazil has a green flag, in the centre of which is a large yellow lozenge with major axis horizontal. On the lozenge is a disk of blue, on which appears a representation of one of the heavenly constellations, and upon this sphere is a band inscribed with the motto *Ordem e progresso* (Order and progress).

Chile. The national ensign and merchant flag of Chile is composed of two equally wide horizontal stripes, white above and red below, with a canton next the flagstaff blue, and bearing a white five-rayed star.

Colombia. The flag of Colombia has at the top a broad, yellow, horizontal stripe occupying half the flag, below which is a light-blue stripe and then a red one. The merchant-marine flag has at the centre an upright red oval inclosing a blue ground on which there is a white star. The naval flag has the state arms in the centre of the flag.

Costa Rica. The national flag is made of five horizontal stripes of color. The top is blue, below white. The central band is red, broader than the others. Below this is white, and lowest is blue. The naval flag shows the arms of the state on the centre of the broad red stripe, while the merchant flag is plain.

Cuba. Cuba has a blue and white arrangement of horizontal stripes, three blue and two white. Next the flagstaff is a triangle with base to the hoist and point in the central blue stripe. The triangle is red, with one white star upon it.

Dominican Republic. The flag of the Dominican Republic has a white upright cross upon it. The upper quarter of the flag next the staff is blue, the corresponding top quarter remote from the staff is red. The lower quarter next the staff is red, and the remaining one is blue. The merchant flag is plain, while the naval flag has the national device shown at the intersection of the arms of the cross.

Ecuador. Ecuador's flag has broad yellow in the upper half of the flag, blue below, and red beneath. The two lower stripes are each one-quarter of the hoist measurement. The national ensign has the state arms in the centre of the flag, while the merchant flag is plain.

Guatemala. The flag of Guatemala is blue, white, and blue, arranged in three broad vertical bands. The state arms occupy the centre of the white band, and upon a scroll under the arms are the words *Libertad 15 de Setiembre 1821*. The merchant flag is without the national device.

Haiti. The merchant flag is plain blue and red in horizontal stripes, the blue above. The naval ensign shows the national badge on a rectangle of white at the centre of the flag.

Honduras. Honduras has the same colors in the national flag as those of Guatemala, but they are arranged horizontally—blue on top, white central, and blue below. The ensign has the national badge in the centre and five gold stars below it. The merchant flag shows five gold stars in the centre of the white stripe.

Mexico. Mexico has a tricolor of vertical stripes. The stripe next the flagstaff is green, the outer one is red. The central stripe is

white, with the badge of the Republic shown upon it for the naval flag. The merchant flag is plain.

Nicaragua. The flag is blue, white, and blue, arranged horizontally, with the arms of the state shown in the central white stripe when used for warships. The merchant flags have a blue anchor instead of the national arms.

Panama. The national ensign is a quartered flag. Next the flagstaff in the upper corner is a blue star on a white ground. The upper quarter remote from the staff is plain red. The lower quarter next the staff is plain blue, while the outer and lower quarter has a red star on a white ground.

Paraguay. Paraguay has a horizontally arranged tricolor of red, white, and blue—red on top and blue below, with the white central band containing in its centre the arms of the state. The ensign has a lion standing, surrounded by a wreath, and above all is a red Phrygian cap carried on a pole. It has a reverse badge on the other side of the flag, different from that on the front, both, however, are oval. The merchant flag is like the ensign except that the badge is different from that on the ensign, being circular in form. Both sides of the merchant flag are alike.

Peru. The President's flag and the ensign of Peru is a vertical tricolor, red, white, and red. The arms of the state appear in the centre of the white band. The merchant flag has the same arrangement of colors, but the state arms are absent.

Salvador. Salvador's ensign is composed of three horizontal stripes—blue above and below and white central. In the centre of the white band are shown the arms of the state, with the words in Spanish *Republic of Salvador and Central America*. The merchant flag is the same as the ensign, but on the centre of the white band are the words in golden letters, *Dios—Union—Libertad*, arranged in a circle without the arms of the state.

Uruguay. Uruguay has a flag composed of horizontal stripes, alternately white and blue, there being five white and four blue. On a white canton there is the golden sun in splendor.

Venezuela. The naval flag is a tricolor with horizontal bands—yellow on top, blue centre, and red below. The arms of the state are placed on the yellow stripe, in the upper corner next the flagstaff. The centre of the flag is occupied by seven white stars arranged in a group. The merchant flag is like the ensign, with the arms of the state omitted, but the seven stars appear.

NATIONAL FORMULARY, OF UNOFFICIAL PREPARATIONS. A book of medicinal formulæ which are frequently prescribed by physicians or demanded by the public, but which are not recognized by the *Pharmacopœia* (qv), either because they were not thought of sufficient importance or because they originated subsequently to the last edition of the official work. The *National Formulary* is compiled by a committee of the American Pharmaceutical Association and published by the society, based upon a similar work prepared in 1882 by the College of Pharmacy of the City of New York, the King's County Pharmaceutical Society, and the German Apothecaries Society of the City of New York. The first edition appeared in 1888, the second in 1896, and the present, the third, in 1906, always following the appearance of the last edition of the *Pharmacopœia*. It contains about 600 preparations, with an appendix of about 75 more which had been dismissed from the *Pharmacopœia* of 1890 and 1900.

NATIONAL GALLERY. The term National is often applied to galleries and museums belonging to the state. Thus, there are important national museums at Naples, Florence, Munich, Stockholm, and Copenhagen. The best-known collections bearing the title National Gallery are one at Washington devoted chiefly to American painting, another at Berlin, devoted chiefly to modern German painting, and the important gallery of painting in London, situated on the north side of Trafalgar Square. The building, in classical Greek style, was erected from designs by Wilkins between 1832 and 1838 and originally cost £96,000. It was enlarged in 1860, 1876, and 1886. The gallery, formed in 1824, rapidly increased in size and received important collections of paintings, presented or bequeathed by Robert Vernon in 1847, J. M. W. Turner in 1856, Wynn Ellis in 1876, Henry Vaughan in 1900, and George Galting in 1910. It has besides received important financial bequests and state aid. The National Gallery is particularly rich in the paintings of the Italian school, including magnificent examples by Crivelli, Piero della Francesca, Giovanni Bellini, Titian, Moroni, and Raphael's *Assisei Madonna*; but the early Flemish and Dutch schools (with several fine Rembrandts), and especially the old English masters, are also well represented. The modern British sculptures and paintings are housed in the National Gallery of British Art (Tate Gallery), a branch of the National Gallery, provided by the late Sir Henry Tate (qv); and British portraits in

the National Portrait Gallery, founded in 1850. The national collections now embrace 1880 works of art, most of which are in the National Gallery. Consult: J. P. Richter, *Lectures on the National Gallery* (New York, 1898); J. de W. Addison, *Art of the National Gallery* (Boston, 1906); P. G. Konody and others, *National Gallery* (2 vols., New York, 1909).

NATIONAL GUARD (Fr. *Garde Nationale*). From 1789 to 1871 the name of the French militia under municipal control, recruited from the middle class. The French Revolution really brought about the creation of the National Guard, though guards of a like nature had existed in some towns previous to 1789. In that year, however, they were instituted in Paris, on the suggestion of Mirabeau, by the Revolutionary Committee, as a check on the Royalists. The National Guard thus constituted numbered 48,000 men, and Lafayette received the command. Other battalions were organized in the provinces, and very soon, on paper, the total strength of the National Guard of France was 4,000,000—though the actual available force was not more than 300,000. In 1795, after the National Guard had gone through many of the most eventful scenes of the Revolution, it was reorganized on a less democratic basis. The result was that it showed Royalist leanings and became the bulwark of the middle classes against uprisings of the masses. It rose against the Convention shortly before the dissolution of that body, but the movement was promptly suppressed by Bonaparte with grape shot. This was the insurrection of the 13th Vendémiaire (October 5). For a time the National Guard ceased practically to exist. In 1805, however, the Emperor Napoleon reorganized it, and it rendered him good and efficient service, particularly in the disastrous years 1813-14. After 1815 the National Guard was still maintained, but in 1827 it was dissolved by Charles X. Its members were allowed, however, to retain their arms, and many of them participated in the July revolution of 1830, at which time the National Guard as an institution was revived. In 1848 it helped do away with the monarchy and establish the Republic. After undergoing various reorganizations in 1848, 1852, and 1855 it again became firmly established. The National Guard fought in the Franco-Prussian War in 1870, and at the capitulation of Paris its members were allowed to retain their arms. The result was that during the Commune of 1871 numbers of national guardsmen went over to the Communists. (See **COMMUNE**.) After the establishment of the third French Republic the National Guard was abolished, its place being taken by the system of universal military conscription. Consult C. Poisson, *L'Armée et la garde nationale* (4 vols., Paris, 1858-62), and Thoumas, *Les anciennes armées françaises des origines à 1870* (1b, 1890). For the National Guard of the United States, see **MILITIA**.

NATIONAL HYMNS. It is only within comparatively modern times that patriotism has found expression through the medium of a national song. In the few cases where a national hymn dates back several hundred years it will be found to have assumed its representative character recently. National music is inseparably connected with folk music (q.v.), but is a later development, and instead of representing the work of individuals (influenced by similar conditions and surroundings) it embodies the feelings,

tendencies, and ideas of a people. In other words, folk music is individual in its character rather than national. Needless to say, however, it is the forerunner and basis of national music, which often reaches its culmination in the national hymn. The following list of national hymns covers the most important ones. It is compiled largely from Sousa's *Airs of All Lands* (Philadelphia, 1890).

Argentina Republic—"Oíd, mortales, el grito sagrado" (1810) (Hear, O Mortals, the Sacred Call) Music by D. V. Lopez

Austria—"Gott erhalte Franz den Kaiser" (1797) Words by L. L. Haschka; music by J. Haydn

Belgium—"La Brabançonne" (1830). Words by Jenneval, music by F. Camphout

Bohemia—"War Song of the Hussites."

Brazil—"Hymno da Proclamação da Republica" (1889) (Hymn of the Proclamation of the Republic) Words by Medeiros e Albuquerque; music by Leopoldo Miguez.

Burma—"Kayah Than" (Sound the Trumpet).

Chile—"Dulce Patria" (national air); by Carricer

Costa Rica—"De la Patria." Music by M. M. Gutierrez.

Denmark—"King Kristian stod ved høien Mast" (King Christian Stood beside the Mast). Words by Ewald, music by Hartman.

Ecuador—"Salve, O Patria"

Egypt—"Salaam, Effendina" (March of the Khedive)

Finland—"Vårt land" (Our Land). Words by J. L. Runeberg, music by F. Pacius

France—"La Marseillaise" (q.v.). Words and music by Rouget de Lisle.

Germany—"Heil dir im Siegerkranz." Words by H. Harries to music of "God Save the King" (q.v.)

Great Britain—"God Save the King" (q.v.).

Holland—"Wien Nêerlands."

Hungary—"Isten áld meg a Magyart" (Lord Bless the Hungarian). Music by F. Erkel.

Italy—"Royal March" (national air), by G. Gabetti.

Japan—"Keenê gejo" (May the Empire Last).

Mexico—"Mexicanos, al grito de guerra" (national air) (Mexicans, at the Cry of War), by J. Nunó

Nicaragua—National air, by Blas Villatas

Norway—"Ja vi elsker dette Landet" (Yes, we Love this Land of ours) Words by Bjørnstjerne Bjørnson, music by R. Nordraak.

Persia—"Salamati Shah." Music by A. Lemaire

Peru—"Somos libres, seámoslo siempre" (We are Free; let us be so ever)

Rumania—"Traeasca Regale" (1862) (Long Live the King)

Russia—"Boghe Zaria chrany" (1830) (God Protect the Czar) Words by Zhukovsky, music by A. Lyoff

Salvador—"Saludemos la Patria" (Let us Hail our Country). Words by J. J. Canas; music by J. Aberle

Servia—"God in His Goodness." Music by D. Jenko.

Spain—"Himno de Riego." Music by Herta

Sweden—"Ur svenska hjertans djup" (Out of the Swedish Heart)

Switzerland—"Rufst du, mein Vaterland," to music of "God Save the King."

United States—"Star-Spangled Banner."

Uruguay—"Himno Nacional de la República Oriental del Uruguay."

Venezuela—"Gloria al bravo pueblo" (1811) (Honor to a Brave Nation). Words by V Salas, music by J. Sandaeta

Emil Bohn, *Die Nationalhymnen der europäischen Völker* (Breslau, 1908); H. F. Chorley, *The National Music of the World* (London, 1912).

NATIONAL INSTITUTE OF ARTS AND LETTERS. (See ACADEMY OF ARTS AND LETTERS, AMERICAN.) These two organizations received jointly in 1915 the site for a permanent home. It was given by Archer M. Huntington and adjoins the property in New York City which the same donor provided for the American Geographical Society and the Hispanic Society.

NATIONALISM. A term applied to the plan of social reform outlined in Bellamy's *Looking Backward*. The scheme involved the nationalization of the processes of production and distribution. It is a form of socialism which emphasizes the social importance of economic equality.

The first Nationalistic Association was organized by a company of Bellamy's readers in Boston in 1889. A statement of its views condemned the system of competition and expressed the belief that it would gradually be supplanted by a system of universal brotherhood. The movement spread rapidly, and by 1891 there were in the United States 162 clubs. In some States, notably California, an active part was taken in politics. In May, 1889, was started a magazine, the *Nationalist*, which existed two years. Its place was then taken by the *New Nation*, founded by Bellamy, which also lasted two years. The Nationalists exercised a considerable influence upon the People's party, but did not play any considerable independent rôle. The movement spread to England, where the Nationalization Society was organized July 3, 1890. See SOCIALISM.

Consult Edward Bellamy, "The Programme of the Nationalists," in the *Forum* (New York, March, 1894); R. T. Ely, *Socialism and Social Reform* (New York, 1894); Edward Bellamy, *Looking Backward* (new ed., Boston, 1898).

NATIONALISM. A modern historical tendency having for its objective the organization in well-knit political states of populations naturally bound together by ties of nationality. Nationality itself is conceived by the proponents of the tendency as including community of language, traditions, morals, religion, and, in a broad sense, culture (*Kultur*). In the early period of nationalism much stress was laid also upon community of race, but more recent ethnological studies have rendered the hypothesis of race as a basis of culture untenable.

In its modern form nationalism is an outgrowth of the French Revolution, with its emphasis upon the independence and unlimited sovereignty of nations. Before the Revolution England and France were indeed national states, the political organization being coterminous with the cultural, but nationalism had not assumed the form of a conscious force. Conscious nationalism developed in France in her struggle with hostile coalitions. The ideal was taken up

by German statesmen, philosophers, and poets during the revolutionary period, and made steady progress, despite the obstacles of particularism, or the sentiment of state autonomy, finally reaching its culmination in the formation of the German Empire, under the statesmanship of Bismarck, in 1871. A similar movement appeared in Italy in the second decade of the nineteenth century, resulting, after a half century of revolutionary activity, in the creation of a united Italy in 1861. The national movement in Greece, originating about the opening of the nineteenth century, was crowned in 1830 by the establishment of Greece as an independent kingdom, though most of the territories inhabited by Greeks remained under Turkish rule. Nationalism in the Balkans, awakened not much later, led to a series of revolts, with resulting experiments in autonomy, and finally the recognition of the independence of Rumania, Bulgaria, Servia, and Montenegro, under the Treaty of Berlin. Norwegian independence (1905) and the creation of an independent Albania in 1913 may be regarded as outgrowths of the nationalism movement, although in the latter case the condition of independence was imposed by the diplomacy of the Great Powers instead of arising out of a spontaneous popular movement.

While nationalism achieved its final purpose in the instances cited, it has failed of its object despite active movements, often accompanied by insurrection, in the cases of Hungary, Bohemia, Poland, Finland, and Ireland. Abortive nationalist movements have also made their appearance in India, Egypt, and the Philippine Islands. Further, even in cases in which a part of a nation has achieved political organization, other parts have remained under foreign rule. Familiar examples of national fragments under alien domination are Alsace-Lorraine under Germany, the Italian-speaking territories of the Trentino and Istria under Austria-Hungary, Bosnia and Herzegovina—largely inhabited by Servians—under Austria-Hungary, and, down to the Balkan wars, the Greek, Servian, and Bulgarian sections of Macedonia, and Thrace under Turkish rule. In each case an active movement (Irredentism) has been conducted in such "unredeemed" territories for annexation to the state representing the national unity. In reaction against Irredentism the states dominating such territory have pursued policies of forced assimilation through the imposition of their language as a medium of public instruction, official business, etc.

Nationalism was the chief cause of military conflicts in the nineteenth century. In addition to the revolutionary struggles inherent in the movement and the wars created by Irredentist agitation, nationalism has in some instances favored foreign war as a force making for domestic unity. This was notably the case with the Franco-German War of 1870, which was regarded as desirable by German statesmen on account of its effect in sinking local jealousies in a vital common cause.

In the United States nationalism as a movement had for its object the subordination of the States to the central government. This object came near to realization in the Constitution; the residual element of State sovereignty was in large measure extinguished by the Civil War. In recent years an attempt has been made to intensify the nationalism tendency through the inauguration of economic policies designed to

give the Federal government a more positive rôle in industrial and social development. This movement, which is represented especially by a section of the Progressive party, has been somewhat vaguely characterized as the "new nationalism." (See *NEW FREEDOM*.) The new nationalism derives much of its force from the example of German nationalism, which has developed the relations between the state and industry with remarkable success. See *SOCIALISM, State Socialism*.

Nationalism does not imply a self-contained economic policy, on the contrary, it regards the foreign trade and investment relations of citizens as particularly deserving the solicitude of the state, hence an active interest in the export trade, often supported by subsidies, measures designed to further shipbuilding, commercial treaties, and, on occasion, acquisition of colonies (See *IMPERIALISM*). It seeks to put barriers in the way of emigration and to place restrictions upon aliens doing business in the home market. In this respect it is sharply to be contrasted with the cosmopolitan tendencies of nineteenth-century liberalism.

NATIONALITY. The condition or status of belonging to a nation or sovereign state. A person so related to a state, as citizen, subject, or national, owes allegiance to such state and is entitled to its protection at home and abroad. Every person is born a national of some state, but, as each country defines for itself by its municipal law what circumstances of birth determine its nationality, considerable divergencies exist. The one universal rule is that a person born in a country of parents who are subjects or citizens of that country is himself a citizen or subject thereof. But the status of a person born of alien parents or of one born in a foreign land varies in different countries. In some countries the locality of birth, irrespective of parentage, is the determining factor, in others the nationality of the parents determines that of the child wherever born, and there is a marked tendency at the present time to employ both principles, so that every person born within a country and in addition every person born abroad of subjects of such country is ipso facto a subject or national thereof.

Great Britain and the United States confer the status of citizens or subjects both on the children of aliens born within their respective dominions and on the children of their own citizens born abroad. Most European states rely on the principle of nationality of the parents and claim no allegiance from the children of aliens who may be born within their territory, but by laws enacted in 1889 and 1893 France claims as her citizens children born on her soil if one of the parents is a French citizen. It is obvious that the combination of the two principles of nationality of parents and locality of birth will often have the curious result of conferring on one and the same person a double nationality. Thus, a child born in the United States of English parents is at the same time a British subject and an American citizen. This difficulty is partially met by the laws of several countries which give to a person with a double nationality the right to disclaim or renounce one of them on attaining his majority.

The nationality acquired by birth may be lost through the acquisition of another nationality by naturalization. Most countries make provision by law for the naturalization of resident

aliens, who by that process usually acquire full citizenship, though not necessarily all the political rights of natural-born citizens. The law governing naturalization usually requires the applicant for citizenship to renounce his allegiance to the sovereign or government of the country of which he was at the time a citizen, but it is clear that such renunciation can have no legal effect outside the naturalizing state unless the new status is recognized by the state whose allegiance is renounced.

The maxim that no one can renounce his nationality (*Nemo protest exuere patriam*) is the common law of all modern states and was English law up to the year 1870, when by Act of Parliament (The Naturalization Act, 33 and 34 Vict., c. 14) it became possible for a British subject on acquiring a foreign nationality to renounce his British nationality, and this principle was after much conflict of opinion adopted by the United States in 1868 by an Act of Congress which declares that "the right of expatriation is a natural and inherent right of all people." By a series of naturalization treaties concluded between 1868 and 1902, most foreign states accepted the principle that naturalization in the United States absolved their subjects from their former nationality. Russia, however, still regards as her own nationals all of her subjects who have been naturalized in other countries, and some other states, like Italy, regard such subjects as still liable to military service or as punishable with death if they bear arms against their native country. An American citizen may also forfeit his nationality, if a naturalized citizen, by returning to the country of his former allegiance and residing there for two years or by residing in any other foreign country for a period of five years, unless it be as a representative of American trade or commerce or for purposes of health or education, and unless he intends to return permanently to the United States to reside (Act of Congress, March 2, 1907), and even a natural-born citizen forfeits his American citizenship by leaving the United States and establishing himself in a foreign country without any definite intention to return to the United States.

The foregoing rules with regard to citizenship and naturalization apply to women as well as to men, with the exceptions that an alien woman who marries an American citizen thereby acquires the status of her husband and that an American woman who marries an alien, whether resident in this country or abroad, by that act loses her American citizenship. It was also provided by the Act of 1907, previously referred to, that the citizenship of an alien wife acquired by marriage is not lost by the death or divorce of her husband, and that the American wife of an alien husband may after his death or after divorce resume her American citizenship either by residing in the United States or, if living abroad, by registering as an American citizen within one year with a consul of the United States.

The doctrines of nationality above set forth are a part of the municipal, or domestic, law of the various nations, and do not trench upon international law except in those cases where, by treaty or otherwise, the right of a person by naturalization to renounce a former nationality comes into question. But international law recognizes the right of a state to the allegiance

of all the subjects of a conquered territory or of territory acquired by cession, occupation, or discovery. Thus, the citizens of Alsace and Lorraine were by the Treaty of Frankfurt, which brought the Franco-German War of 1870-71 to a close, transferred from French to German nationality. The modern practice of nations has in such cases permitted the citizen or subject inhabitants of such a territory to elect whether they would remain as nationals of the new sovereign or remove to other territory of their former allegiance.

NATIONAL LITERARY SOCIETY OF IRELAND. See IRISH LITERARY SOCIETY.

NATIONAL MONUMENTS. National monuments are reservations that have been established by proclamation of the President in accordance with the Act of June 8, 1906, which provides that he may in his discretion "declare by public proclamation historic landmarks, historic and prehistoric structures, and other objects of historic and scenic interest that are situated upon the lands owned or controlled by the Government of the United States to be national monuments, and may reserve as parts thereof parcels of land." The same act authorizes the Secretaries of the Interior, Agriculture, and War to make uniform regulations governing the excavation of ruins and archaeological sites and the collection of objects of antiquity by public institutions. Uniform regulations were published on Dec. 28, 1906, and each Secretary issues permits for excavations in the monuments within his jurisdiction.

National monuments are not essentially different from national parks except in methods of establishment and administration. The monuments are as a rule smaller than the national parks. Congress has provided neither funds nor administrative machinery for protecting the lands reserved as monuments. They have consequently been placed under the charge of the nearest administrative officer of one of the three departments. In the list below the area of each monument and the date of establishment are given in parentheses.

The following monuments are under the supervision of the Secretary of the Interior: Natural Bridges, Utah (2740 acres, April 16, 1908, and Sept. 25, 1909), includes the three largest natural bridges known, the Augusta Bridge, the largest, measures 320 feet from wall to wall and has below it a clear opening of 265 feet. Rainbow Bridge, Utah (160 acres, May 30, 1910), includes a natural bridge that has a curved surface above as well as below, it has a height of 309 feet and a span of 278 feet. El Morro, New Mexico (160 acres, Dec. 8, 1906), includes an enormous sandstone rock on which the Spanish explorers of the seventeenth and eighteenth centuries carved many inscriptions that are of historical importance. Muir Woods, California (295 acres, Jan. 9, 1908), is near the city of San Francisco and includes a fine

redwood grove which was presented to the United States by William Kent. Petrified Forest, Arizona (25,625 acres, July 31, 1911), includes a large area in which the prostrate trunks of petrified trees are exposed on the surface. Devil's Tower, Wyoming (1152 acres, Sept. 24, 1906), is a steep-sided shaft of rock 600 feet in height. Montezuma Castle, Arizona (160 acres, Dec. 8, 1906), includes an assemblage of cliff dwellings. Tumacacori, Arizona (10 acres, Sept. 15, 1908), includes the ruins of an old Spanish mission. Chaco Cañon, New Mexico, (20,629 acres, March 11, 1907), includes the largest prehistoric ruin discovered in the Southwest. Gran Quivira, New Mexico (160 acres, Nov. 1, 1909), includes one of the earliest mission ruins and some pueblo ruins. Navaho, Arizona (360 acres, March 14, 1912), includes a number of ruins of the cliff dwellers. Pinnacles, California (2080 acres, Jan. 16, 1908), includes a number of steep rock formations, under which are caves. Mukuntuweap, Utah (15,840 acres, July 31, 1909), includes a remarkable cañon from 800 to 2000 feet deep. Shoshone Cavern, Wyoming (210 acres, Sept. 21, 1909), includes a limestone cave which has been explored in part only. Sitka, Alaska (57 acres, March 23, 1910), includes the site of an old Indian village where the Indians defeated the Russians in 1804. Lewis and Clark Cavern, Montana (160 acres, May 16, 1911), includes a limestone cavern of great beauty. Colorado, Colorado (13,883 acres, May 24, 1911), includes many impressive and colored rocks similar to those in the Garden of the Gods. Papago Saguaro, Arizona (2050 acres, Jan. 31, 1914), includes a collection of characteristic desert flora as well as prehistoric pictographs.

The following monuments, most of which are in national forests, are under the jurisdiction of the Secretary of Agriculture: Grand Cañon, Arizona (806,400 acres, Jan. 11, 1908), includes the Grand Cañon of the Colorado River. Cinder Cone, California (5120 acres, May 6, 1907), is of scientific value in the study of volcanic activity. Lassen Peak, California (1280 acres, May 6, 1907), includes the volcanic cone of Lassen Peak, which was supposed to be extinct, but which was in eruption in 1914. Gila Cliff Dwellings, New Mexico (160 acres, Nov. 16, 1907), includes some cliff dwellings in a region where few are found. Tonto, Arizona (640 acres, Dec. 19, 1907), includes two ruins of prehistoric cliff dwellings. Jewel Cave, South Dakota (1280 acres, Feb. 7, 1908), comprises a limestone cavern of considerable interest. Wheeler, Colorado (300 acres, Dec. 7, 1908), includes a number of fantastic pinnacles that are the result of erosion. Oregon Caves, Oregon (480 acres, July 12, 1909), includes a limestone cave that has been only partly explored. Devil Postpile, California (800 acres, July 6, 1911), includes an area of basaltic rock in the form of immense columns. Mount Olympus, Washington (608,480 acres, April 17, 1912), includes a mountain area comprising a number of glaciers as well as the breeding ground and summer range of the Olympic elk.

The following national monuments are under the jurisdiction of the Secretary of War: Big Hole Battlefield, Montana (5 acres, June 23, 1910), embraces a tract on which a battle was fought with the Nez Percé Indians in 1877. Cabrillo, California (21,910 square feet, Oct. 14, 1913), includes Point Loma on San Diego

Bay, where Cabrillo discovered California in 1542.

An annual report on the national monuments is issued by the Department of the Interior.

NATIONAL MUSEUM. See UNITED STATES NATIONAL MUSEUM.

NATIONAL NICKNAMES (ME. *nekename*, *ekename*, by faulty liaison for an *ekename*, additional name, from *eke* + *name*). National nicknames are as a rule first employed by the people themselves. By the familiar JOHN BULL is meant the English nation. The name was first used in the satire of Dr. John Arbuthnot, *Law is a Bottomless Pit*. The sobriquet of JONATHAN or BROTHER JONATHAN has gone through three distinct phases. First, between 1776 and 1783 it was employed, as a mildly derisive term, by the Loyalists, and applied by them to the Patriots; secondly, between 1783 and 1812 it was adopted by the Americans themselves, who used it to designate a country bumpkin; and thirdly, during the war with England in 1812-15 it came into universal vogue as a national sobriquet. The accepted story attributing the origin of the term to a remark made by Washington in allusion to Governor Jonathan Trumbull of Connecticut originated in 1846, and has recently been shown to be without foundation. UNCLE SAM, the familiar sobriquet of the United States government or people, is commonly stated to have originated at the outbreak of the war with England in 1812, when some one, asking what the letters U. S. marked on casks and barrels meant, was facetiously told that they referred to "Uncle Sam" or Samuel Wilson, an obscure citizen of Troy, N. Y., said to have been an inspector or a contractor. This story has not been found earlier than 1842, when it was given in J. Frost's *Book of the Navy*, p. 297. No doubt Frost copied it from some newspaper, but the story lacks proof. The term Uncle Sam has yet to be traced earlier than the fall of 1813, when we read of "Uncle Sam's men," meaning United States customhouse officers, and are told that "Uncle Sam, the now popular explication of the U. S., does not pay well." The term appears to have arisen somewhere in the North, perhaps in New York or Vermont, and its origin was presumably merely a jocular extension of the abbreviation U. S., then very common. For three years it ran a career in the newspapers, in 1816 it appeared in a book, and by 1817 its popularity was well established. The American dubs the Mexican GREASER, thereby aspersing the tidiness of the latter's appearance; while the Mexican or Spanish-American returns the compliment with the term GRINGO (the Spanish word for gibberish), which serves to distinguish an American, or, as in South America especially, an Englishman. NICHOLAS FROG, the typical Dutchman, was first used by Arbuthnot in his *Law is a Bottomless Pit*. JEAN CRAPAUD (toad) is the popular nickname of the French nation, collectively taken, and dates back to the time when the ancient kings of France used for their device in heraldry "three toads, erect, saltant," or in a leaping posture, and Paris was called Lutetia, or Mudland. Its streets were so quaggy that the French court called its inhabitants "frogs." An Australian is said to answer to the name CORNSTALK. For the French Canadian we have JEAN BAPTISTE, JOHNNY, JACK, and CANUCK, this last a word of American Indian origin. JACK CANUCK, the type of the young Canadian pioneer,

whether of French or British origin, is represented in some of the Canadian comic papers with his sleeves rolled up and carrying an axe on his shoulder. The French peasant is facetiously called JACQUES BONHOMME. DON stands for a Spaniard, in allusion to the dignity of bearing proper to the type. DEUTSCHER MICHEL, signifying a simple countryman, is the facetious nickname applied to the German people, and intended particularly to satirize the weaknesses and foibles of the national character, especially their proverbial lethargy, heaviness, and credulity. A racial, if not a national, designation for the negro is BLACKAMORE, while in the United States an "unbleached American" should come if called SAMBO. SAWNEY is the sportive designation sometimes applied by the English to the Scotch, and is probably a corruption of Sandy, the abbreviation of Alexander. It was first given to the Scotch by Coleridge. TAFFY, the Welshman, is a corruption of David, one of the most common of Welsh names. PADDY, from Patrick, refers to the Irish. JOHN CHINAMAN is the popular nickname for the Chinese. The Russian nickname, IVAN IVANOVITCH, denotes the typical muzhik as found all over Russia.

NATIONAL REPUBLICAN PARTY. See WHIG PARTY.

NATIONAL SECURITY LEAGUE. An organization incorporated in 1914 by citizens who were convinced that the United States is not adequately prepared for defense. The league favors an army and navy with citizen reserves which will be sufficient only for adequate protection of the country. It does not believe in a large standing army or in any form of militarism. One of its purposes is to lay before the country the plans of defense which have been studied out by the General Staff of the army and the Naval Board, and which have been approved by the successive administrations of the Army and Navy departments. Its further purpose is to urge citizens to cooperate in insisting that Congress pay heed to these advisers and make necessary provision for the protection of the country. Among the means of bringing about these ends is the appointment of a nonpartisan commission of experts and laymen by Congress to consider the problem of defense and bring its conclusions to the attention of the country. The league has committees on army, navy, militia, extension, membership, and finance. The honorary president at the time of its organization was Hon. Joseph H. Choate. The league is a national body with branches throughout the country.

NATIONAL STANDARDS AND EMBLEMS. See STANDARD; NATIONAL ARMS.

NATIONAL UNION. A fraternal beneficiary secret society formed by prominent members of like fraternities at Mansfield, Ohio, in 1881 and incorporated in that State. It led in adopting assessments, graded according to age. Its government is patterned nominally after that of the United States. It reports 747 senate councils, nearly 62,500 members, and total benefits disbursed, nearly \$40,000,000.

NATIONAL UNIVERSITY. The proposal to establish a national university in the United States has been frequently mooted since the idea was put forward by George Washington in his first message to Congress. Washington's purpose was to create a great Federal institution of learning at the national capital to provide opportunities which so many students were

seeking in Europe. The project has had its supporters among several succeeding Presidents and was advocated as recently as February, 1915, by ex-President Taft before the National Education Association meeting at Cincinnati. In the early days of the Republic the constitutionality of the maintenance of such an institution by Congress was questioned. More recently the project has been favorably reported upon by committees of Congress in 1890, 1893, 1894, 1896, and 1902, and numerous bills have been introduced—one as recently as 1914 (Sen 4881, H. Rep. 11,749)—but never with any success.

In general, it is not now intended to establish a university in the ordinary sense of the term so much as to coordinate the facilities now existing in Washington for graduate study. Since it briefly summarizes the intentions of the supporters of the scheme the chief contents of the bill introduced in 1914 may be quoted. The National University is to be created "for the purpose of promoting the advance of science, pure and applied, and of the liberal and fine arts by original investigation and research and by other suitable means; to provide for the higher instruction and training of men and women for posts of importance in the public service of State and Nation and for the practice of such callings and professions as may require for their worthy pursuit a higher training, and to co-operate with the scientific departments of the Federal government, with the Land Grant Colleges founded in pursuance of the Morrill Acts of 1862 and 1890, with the State universities, and with other institutions of higher learning throughout the country. Persons to be admitted must have BS or BA degree from an institution of recognized standing, or have pursued an equivalent course." The facilities afforded for research studies in Washington, it may be pointed out, include the Library of Congress, the National Museum, the Smithsonian Institution, the Medical Museum, the Patent Office, the Corcoran Gallery, the National Botanic Gardens, the Geological Survey, the observatories, and the government Bureaus of Standards, Statistics, Plant Industry, Soils, Fisheries, Entomology, and Public Roads, all of which represent an equipment of about \$60,000,000, and many of which are already open for purposes of research. See also AMERICAN UNIVERSITY.

NATIONAL UNIVERSITY OF IRELAND. An institution for higher education established by Act of Parliament in 1908. By this Act the existing Royal University of Ireland was dissolved and in its place were established the Belfast University and the National University of Ireland. The latter consists of three constituent colleges—University College, Dublin, Queen's College, Cork, and Queen's College, Galway. The chief purpose sought in this reorganization was to provide an institution that would meet the wishes of the Roman Catholics. While the National University is undenominational and free from tests, religious instruction may be given, but not out of public funds. The university received the sum of \$850,000 for buildings and equipment and an annual grant of \$320,000. The following faculties are maintained: arts, philosophy, and sociology, Celtic studies, law, medicine, science, engineering and architecture, and commerce. The enrollment in 1912-13 was about 1440 in the three constituent bodies (University College, 870; Cork, 429; Galway, about 140).

NATIONAL WORKSHOPS, or *ATELIERS NATIONAUX*, a'to-lyá' ná'syó'nó'. A plan of giving public employment attempted in France in 1848. The provisional government organized on the overthrow of Louis Philippe by the February revolution passed a decree (February 25) defended by its Socialist members—Louis Blanc, and a few others—declaring the "right to work" and pledging the government to guarantee employment for idle workmen. A few days later "national workshops" were established. As a matter of fact there were no workshops opened; the work provided was in the open air, and consisted largely in planting trees, digging, and constructing roads—works for which few of the applicants were adapted. Their number, however, increased from day to day and at one time reached 130,000. No work could be found for many of the applicants, these received 30 cents a day, while those actually employed were paid 40 cents, although the work they performed was scarcely worth the additional 10 cents. Under these circumstances many workers who were in private employ demanded higher wages or were content to give up their places and remain idle so long as they might receive 30 cents per day for doing nothing. Several attempts were made to bring the scheme within the range of practical feasibility, but political disturbances and personal jealousies made it impossible to carry them out. After four months' trial and a total expenditure of 14,000,000 francs, the system was abandoned when General Cavaignac became Chief of the Executive.

The national workshops are sometimes erroneously confounded with the *ateliers sociaux* in Louis Blanc's plan of labor organization.

NATIVE (from Lat. *nativus*, natal, inborn, from *nasci*, to be born, connected with Gk *γενεσθαι*, *gignesthai*, Skt. *jan*, AS. *cennan*, archaic Eng *ken*, to beget). A term applied in chemistry and mineralogy to elements, especially the metals, when found in nature in a chemically free state.

NATIVE BEAR. The Australian koala (q.v.).

NATIVE COMPANION. The Australian Balearic crane (q.v.).

NATIVE PARAFFIN. See OZOCERITE.

NATIVITY (Lat. *nativitas*, birth, from *nativus*, natal, inborn), THE. The birth of Christ, a favorite subject in most periods of Christian art. The Virgin is usually represented as the joyous mother in the act of adoration, Joseph as grave and silent; the ox and the ass, which according to traditions witnessed the birth and adored the Christ child, as well as ministering and singing angels, are usually present. In painting the contemporaneous adoration of the shepherds is often added to the scene. The subject occurs occasionally in early Christian sarcophagi, more frequently in ancient and mediæval ivories, and often in illuminated manuscripts. In the revival of sculpture and painting during the thirteenth and fourteenth centuries it is one of the most popular subjects, and is always depicted in the cycle of the life of Christ—by the Pisani in their pulpit reliefs at Pisa, Siena, Pistoia, etc.; by Giotto at Assisi, the Arena Chapel, Padua, and Santa Croce, Florence; by Duccio in his "Majestas," Siena Cathedral; and by many others. In the fifteenth century it was painted with great sweetness by Fra Angelico at San Marco and elsewhere, by Filippo Lippi (Florence Acad-

emy): by Ghirlandaio (Dresden Gallery); by Piero della Francesca and Botticelli (National Gallery, London); by Tintoretto in San Rocco, and, most celebrated of all, by Correggio in his "Holy Night" (Dresden Gallery). (See Plate of CORREGGIO.) The sculptors of the fifteenth century represented the subject in the group called "Presepio," of which there is a good example by Antonio Rossellino in the Metropolitan Museum, New York, and in reliefs. The most celebrated paintings on the subject by Germanic painters are by Hugo van der Goes (Uffizi, Florence), by Albrecht Dürer, especially in his great series of engravings, and by Rembrandt (Pinakothek, Munich). Consult the bibliography of JESUS CHRIST IN ART.

NATOMA, nā-tō'ma. An opera by Victor Herbert (q.v.), first produced at Philadelphia, Feb. 25, 1911.

NATORP, na'tōip, PAUL GERHARD (1854-). A German philosopher of the Neo-Kantian type. He was born at Dusseldorf, studied in Berlin, Bonn, and Strassburg, and in 1885 became professor extraordinary and in 1893 professor at Marburg. His works include *Descartes's Erkenntnistheorie* (1882); an edition of Democritus' *Ethics* (1893), *Religion innerhalb der Grenzen der Humanität* (1894, 2d ed., 1908), *Platos Staat* (1895), *Sozialpädagogik* (1898, 3d ed., 1909), *Platos Ideenlehre* (1903), *Allgemeine Psychologie in Vorträgen zu akademischen Vorlesungen* (1904, 2d ed., 1910), *Allgemeine Pädagogik in Vorträgen zu akademischen Vorlesungen* (1905, 2d ed., 1913), *J. H. Pestalozzi* (1906, 2d ed., 1910); *Gesammelte Abhandlungen zur Sozialpädagogik* (1907), *Volk und Schule Preussens vor hundert Jahren und heute* (1908); *Pestalozzi, sein Leben und seine Ideen* (1909, 2d ed., 1912), *Die logischen Grundlagen der exakten Wissenschaften* (1910); *Philosophie, ihr Problem und ihre Probleme* (1911); *Allgemeine Psychologie nach kritischer Methode* (1912); *Hoffnungen und Gefahren unserer Jugendbewegung* (1914).

NATROLITE (from Eng *natron*, from A1. *natrūn*, *natrūn*, native carbonate of soda, from Gk. *νῆτρον*, *nitron*, *λίτρον*, *litron*, nation, of Semitic origin (cf. Heb. *netzer*, from *nātar*, to loose) + Gk. *λίθος*, *lithos*, stone). A mineral sodium-aluminum silicate of the zeolite group. It crystallizes in the orthorhombic system, has a vitreous, sometimes pearly, lustre, is transparent or translucent, and ranges in color from white or colorless to gray, yellow, and red. Natrolite is found in cavities in basalt and other igneous rocks, at various localities in Bohemia, the Tirol, Ireland and Scotland, in Nova Scotia, in the Lake Superior region, and at Bergen Hill, N. J. It is capable of receiving a high polish, and has been used as a gem for rings and other ornaments, especially in the form of the letter N in initial jewelry.

NATRON. A hydrous sodium carbonate that crystallizes in the monoclinic system and is found in nature only in solution, as in the Soda Lakes of Egypt. Of similar character is the *trona*, an impure hydrogen sodium carbonate, which occurs as thin crusts along the margin of lakes in Egypt, Siberia, Tibet, and on the borders of the Black and Caspian seas. These minerals form the source of the soda salts of the ancient Egyptians, and were used by them in their arts, especially in embalming (q.v.). Of like character is the carbonate of soda found at the bottom of the lake at Lagunillas near Mérida,

Venezuela, which is called by the Indians *urao*. Similar efflorescences are found in San Bernardino and Inyo counties, California, where they are formed by the spontaneous evaporation of saline waters. See MUMMY.

NATTER, nāt'tēr, HEINRICH (1846-92). An Austrian sculptor, born at Graun, Tirol. He studied at the Polytechnicum in Augsburg under Guyer and at the Academy in Munich. He lived in Munich and afterward in Vienna. Besides many portrait busts of celebrities he produced a number of memorial statues and groups, notably the Zwingli Monument (1885) at Zurich, the Haydn Monument (1887) in Vienna, "Walther von der Vogelweide" (1889) at Bozen, and the heroic statue of Andreas Hofer (1892) on Mount Isel, near Innsbruck, his principal work, though less individual in characterization than his other historical statues.

NATTERJACK, nāt'tēr-jāk (from AS *nædre*, Goth. *nadrō*, Ger. *Natter*, adder + *jack*). A common, light-colored, rather smooth toad (*Bufo calamita*) of western Europe, found in sandy districts. Its very active habits have given it the name "running toad" in some localities in England.

NATTIER, na'tyā', JEAN MARC (1685-1766). A French portrait painter, born in Paris. He was the son and pupil of the painter J. B. Nattier, and also studied under Jean Jouvenot and at the Academy. As a youth he was commissioned by the King to make drawings of the Rubens series, then in the Luxembourg; and in 1715 he went to Amsterdam to paint portraits of Peter the Great, of his wife, Catharine I, and of members of their suite. On his return he was received into the Academy (1718), as an historical painter, but after sustaining financial losses confined himself to portraiture. In this field he soon attained great popularity. If Rigaud is the painter par excellence of the men of his time, Nattier has done as much for the women. He painted repeatedly every member of the royal family, and most of the notabilities of the court. Though not exempt from mannerisms, and flattered rather than individualized, his portraits possess abundant charm, great purity of line, and harmonious refinement. His sitters are usually treated as mythological or historical characters. There are many portraits by him at Versailles, such as those of Maria Leszczyńska, Madame Henriette de France, Madame Adelaide, Louise Henriette de Bourbon, and a family portrait of himself with his wife and children. The Wallace collection, London, and the Musée Condé, Chantilly, are rich in fine examples of his work, notably the portraits of Mademoiselle de Clermont, the Louvre possesses five Nattiers, including the celebrated Mademoiselle de Lambesc as "Minerva," and the Metropolitan Museum, New York, contains the Princess de Condé as "Diana." Other well-known works are Madame de Châteauroux as "Dawn" and Madame de Flavacourt as "Silence." Maurice de Saxe, Dresden Gallery, and the Duchesse de Chartres as "Hebe" (1744), Stockholm Gallery. Consult *Masters in Art*, vol. iii (Boston, 1902), containing an exhaustive bibliography, and Pierre de Nolhac, *Nattier, peintre de la cour de Louis XV* (Paris, 1910).

NAT TURNER'S INSURRECTION. See TURNER, NAT.

NATUNA (nā-tōō'nā) ISLANDS. A group of islands in the South China Sea, northwest of

Borneo, belonging to Holland (Map: Australasia, C 2). They are for the most part densely wooded and mountainous, but have some cultivated tracts which produce maize, rice, sago, and coconuts. The area is estimated at 803 square miles, and the inhabitants, who are chiefly Malay fishermen, number about 8000.

NATURAL (from Lat. *naturalis*, according to nature, from *natura*, nature, from *nasci*, to be born; connected with Gk *γενεσθαι*, *gignesthai*, to become, Skt. *jan*, to beget, AS. *cennan*, archaic Eng. *ken*, to beget). In music, the sign ♮, which, placed before a note, counteracts the effect of a previous ♯ or ♭ and restores the note to its normal or natural place. To counteract a double sharp or a double flat (×, bb) a single natural is used, although it was formerly customary to write a double natural (♮♮). This form is superfluous and incorrect. In a key with many sharps or flats a doubly raised or lowered interval is generally restored to the chromatically altered tone required by the key signature. Thus, in G flat a bbb would be restored, not to b, but to bb, which is indicated by ♯b. Likewise in a signature with sharps the natural sign appears as ♮♯.

NATURAL BRIDGE. Any natural structure of rock or earth which spans a depression. Natural bridges may be formed by various kinds of stream erosion, by wave action, by solution, and in a few other ways. There are more than 50 natural bridges of considerable size in the United States. Of these the best known is the celebrated Natural Bridge, in Rockbridge Co., Va., about 16 miles southeast of Lexington (Map: Virginia, E 4). The present structure was left by the collapse of the remainder of the roof of a tunnel formed, according to Cleland, "by water percolating through a joint or fissure athwart the stream, thence along a bedding plane and emptying under a fall or rapid of the stream. The channel thus formed was gradually enlarged until all the water of the stream was diverted from the stream bed below the point of ingress, leaving a bridge." The bridge thus formed has a span of 90 feet, and is from 50 to 100 feet wide. The thickness of its crown is about 40 feet and its arch is 215 feet above the stream. A public road passes over it.

Other remarkable natural bridges, caused by stream erosion, are the Edwin Natural Bridge, in San Juan Co., Utah, height 111 feet, span 205 feet, width 30 feet, thickness of arch 10 feet; the Augusta Sandstone Natural Bridge, near by in the same county, height 265 feet, span 320 feet, thickness 83 feet, width 35 feet; the Nonnezoshi Bridge, about 50 miles to the southwest (discovered in 1909), length 273 feet, height 308 feet, and the Natural Bridge near the railroad station of the same name in Powell Co., Ky., height 32 feet, span 20 feet, thickness about 12 feet. The bridge near Natural Bridge station in Winston Co., Ala., is a remarkably flat and thin arch of sandstone with a span of about 75 feet, of such symmetrical proportions that one could almost believe it to be the work of man. The Massachusetts Natural Bridge, near North Adams, is of the same class as the Virginia example. It is of white marble, spans Hudson Brook, is 44 feet high, about 25 feet wide, and spans about 10 feet. There is a very symmetrical bridge in Santa Cruz Co., Cal., which was formed by wave erosion. In Florida there are several natural bridges formed by solution but differing from the ordinary con-

ception in that they are not elevated above the stream, and the points where the stream disappears and reappears are often so far apart that one cannot be seen from the other. For detailed description of the principal American bridges (with illustrations), consult the interesting article above quoted from, by Professor Cleland, entitled "North American Natural Bridges, with a Discussion of their Origin," in the *Bulletin of the Geological Society of America*, vol. xxi (New York, 1910), and another article by the same author, "The Formation of North American Natural Bridges," in the *Popular Science Monthly* (New York, May, 1911). See NATIONAL MONUMENTS.

NATURAL GAS. See GAS, NATURAL; GAS, ILLUMINATING AND FUEL.

NATURAL HARMONICS. See HARMONICS.

NATURAL HISTORY. A term used at different times and by different authors in a variety of senses. It was applied at first to the study of all natural objects, including minerals, rocks, and all living beings. The study of external nature and of the phenomena or laws governing the movements of natural bodies was formerly opposed to metaphysics, history, literature, etc. After a while astronomy and chemistry were eliminated from natural history, then natural philosophy, or what is now called physics, was separated from chemistry. But natural science, as distinguished from physical science, has made such progress that we must now know whether our naturalist is a mineralogist, a geologist, a paleontologist, a botanist, a zoologist, or a specialist in some narrower department of biological study. At present natural history is confined to the study of organic nature, or biology, and students of general physiology and morphology are called biologists. See BIOLOGY, BIONOMICS.

NATURAL HISTORY OF SELBORNE.

A work by Rev. Gilbert White (1789). It was produced from letters written by the author to Thomas Pennant and to Daines Barrington on outdoor life in a Hampshire village. Written in a style simple and entirely free from self-consciousness, it shows wonderful observation of nature, with a charm that made it an English classic.

NATURALISM. In philosophy, a term used to designate various theories of the universe differing widely among themselves in detail and agreeing only in the claim that nature furnishes an adequate explanation of all that is. But it is obvious that with different conceptions of nature naturalism will take very different forms. The important thing in determining what any naturalism maintains is the ascertainment of what such a naturalism considers as nonnatural. Thus, when the prevailing type of philosophy is theistic (see THEISM), naturalism, as opposed to nonnaturalism in the form of supernaturalism, maintains that the universe must be explained by immanent principles and not by reference to anything that transcends the universe as God in theism is conceived as transcending it. Spinoza (q.v.) with his single substance possessed of an infinity of attributes, two of which are mind and matter, and with this substance as his God, is nontheistic and therefore a naturalist. So similarly Hobbes (q.v.) with his predominant materialism, regarding the motion of matter as the universal cause, is likewise a naturalist. So again when the Kantian philosophy (see KANT) discriminates

THE NATURAL BRIDGE

Copyright, 1900, by the Detroit Photographic Co.

between the realm of nature as including all actual and possible experience, on the one hand, and inexperienceable things in themselves on the other hand, these things in themselves are a nonnatural element in the system, and with this feature of Kantianism in mind any development of the Kantian philosophy that eliminates the things in themselves and leaves only the world of experience is a form of naturalism. Thus, though Hegel (qv) opposed naturalism in the shape of materialism, he has been called a naturalist as denying reality transcendent of experience. But many Neo-Hegelians and Neo-Kantians maintain that the world of nature is organized by a spiritual principle that transcends time, by a timeless consciousness. The objects of this consciousness are in time, but the consciousness itself is not in time, it is eternal. According to this view the realm of objects is the realm of nature; spirit is a higher principle than nature. As opposed to this recent type of idealism we have several forms of naturalism, allied in denying that nature is a realm of objects existing alone for an untimed consciousness. Thus, materialistic mechanism (qv.) is naturalistic, maintaining that the laws of matter account for all events, and that mind is merely an inefficient futile accompaniment of certain physical processes. So radical empiricism, instrumentalism, and neo-realism (qv) are naturalistic, maintaining, each in its own way, that spirit is not presupposed in all nature but is itself a part of nature. Of all these types of naturalism the one that plays the largest part in recent literature as naturalism is perhaps materialistic mechanism.

NATURALISM, IN LITERATURE. See **REALISM** AND **NATURALISM**.

NATURALISTS, AMERICAN SOCIETY OF. An association organized in 1883 to exchange ideas relating to the problems of natural history. The society now has an active membership of 350. The meetings of the society are held annually.

NATURALIZATION. The act or process by which in any country an alien acquires citizenship. The process consists of two parts, viz., the formal renunciation of the old allegiance and the assumption of a new allegiance. The rights and privileges of naturalized citizens are enumerated and defined by the municipal law of every state. In few or no cases are they the same as those of native-born citizens. In the United States they enjoy the same civil rights as natural-born citizens, and all of the political rights except eligibility to the offices of President and Vice President. The right of a subject or citizen to renounce his allegiance with a view to acquiring citizenship in another state is now generally recognized. (See **EXPATRIATION**) In order to prevent possible conflicts of jurisdiction

growing out of the practice of naturalization and the return of naturalized citizens to their native country, it is customary for states to enter into treaties for the regulation of matters relating thereto. Thus, the United States has entered into 11 treaties with foreign powers, in all of which, except that with Great Britain, it is provided that five years of uninterrupted residence with formal naturalization constitutes citizenship on both sides. A majority of these treaties contain the provision that a naturalized citizen returning to his native state shall, after an uninterrupted residence there of two years, be presumed to have renounced his acquired citizenship. It is also a general principle that naturalization does not release an individual from any obligations to his native state which he may have incurred before emigration, as, e.g., military service, and if he returns to such state he may be held to the fulfillment of his obligations without being able to invoke the protection of the United States, unless treaty stipulations provide otherwise.

In the United States the whole matter of naturalization is subject to the regulation of Congress. By the Law of March 4, 1913, the administration of the naturalization laws was placed under the charge of the Bureau of Naturalization, one of the bureaus of the Department of Labor. Books of record are provided by the bureau for each immigration station, and each alien arriving is registered. A certificate of registration is given to such alien, for use in case he desires to apply for naturalization. Exclusive jurisdiction over the naturalization of aliens is given to the United States district courts, United States district courts for the Territories of Hawaii and Alaska, the Supreme Court of the District of Columbia, and to State and Territorial courts of record having jurisdiction in suits in law or equity where the amount in controversy is not limited.

Two years prior to admission to citizenship the applicant must declare before clerk of such court his bona fide intention of becoming a citizen of the United States. Such declaration must state the age, occupation, place of birth, date of arrival in the country, and other particulars that may serve for purposes of identification. Not less than two years, and not more than seven years, after this declaration has been filed, the applicant must file with one of the courts having jurisdiction in the matter a petition signed in his own handwriting, with full name, place of residence, occupation, date and place of birth, etc. The petition must further set forth that he is not a disbeliever in organized government, and that he renounces allegiance to any foreign government, and intends to become a citizen of the United States. The petition must be verified by two credible witnesses, citizens of the United States, who must state that they have known him to be a resident of the United States for at least five years continuously, and of the State or Territory in which the petition is filed for at least one year preceding the application, and that he is of good moral character. Final action on the petition may not be taken within 90 days after it has been filed, and no certificate of naturalization may be granted within 30 days preceding a general election.

No alien may be naturalized who cannot speak the English language. This provision is not applicable to those who are physically unable to

speak, nor to those who shall make homestead entries on the public lands.

Aliens who owe allegiance to the United States (i.e., inhabitants of the dependencies) may file their declaration of intention to become citizens immediately on entering upon residence in the United States, and may after the lapse of not less than two years receive certificates of naturalization. Since 1802 the term of residence has remained at five years. A minor alien who has resided in the United States for three years next preceding his arrival at the age of 21, and who has continued to reside there up to the time of his application, may be admitted to citizenship without the previous declaration, provided he has resided in the United States for a period of five years. Aliens of 21 years and upward who have been honorably discharged from service in the United States army are not required to make the declaration of intention. Similarly aliens who have served five consecutive years in the United States navy, or one enlistment in the marine corps, may be admitted to citizenship without previous declaration of intention. The widow and children of an alien who has declared his intention of becoming a citizen, but dies before completing the steps, have not, since 1906, been regarded as citizens upon taking the oath prescribed by law. An alien woman who marries a citizen of the United States, and who herself might be lawfully naturalized, is considered a citizen. Children born outside of the limits of the United States, but of parents who are citizens, are considered as citizens, but the rights of citizenship in such cases do not descend to children whose parents never resided in the United States. Since 1870 the privilege of naturalization has been extended to aliens of African nativity and of African descent. Chinese aliens are excluded by statute of Congress from the privilege of naturalization.

Consult F. J. Franklin, *Legislative History of Naturalization in the United States* (Chicago, 1906), and G. B. Davis, *Elements of International Law* (3d ed., New York, 1908). See ALIEN, ALLEGIANCE, CITIZEN.

NATURALIZATION. In biology, the establishment of plants and animals in a new region, especially through the agency of man. Primarily, exotic species soon become feral and compete with indigenous species. They frequently never gain a foothold, but if they do they usually spread at first with extraordinary vigor, owing to the absence of their natural enemies. But later an adjustment with the other species in the country occurs, and after that the disproportionate numbers of the introduced form disappear, i.e., the new species become adjusted or naturalized. Compare ACCLIMATIZATION.

NATURAL LAW. Greek Philosophy. Some of the Greek Sophists, and later the Epicureans, held that law and justice were arbitrary conventions established by the weak for self-defense against the natural right of the strong. Socrates, in this as in other matters, antagonized the theories of the Sophists; but it was Aristotle who formulated the conception of natural justice which has remained dominant to the present day. In his view justice is in part legal, in part natural. Legal justice deals with matters which must be regulated, but which may be variously regulated. Natural justice, on the other hand, is not arbitrary; its rules are everywhere similar. The Stoics went further; they asserted that the rules of natural

justice were founded on reason and were therefore discernible by reason; and the later Stoics termed this rational order *natural law*.

Roman Jurisprudence. The Roman lawyers noted the fact that many substantially identical rules were observed by all the Mediterranean nations and to this common law they gave the name "law of nations" (*jus gentium*). In the first century before Christ they began to speak of "natural law." In the Roman juristic literature the term is used in four different senses. 1 Natural law is identified with universal law (*jus gentium*). This is practically the Aristotelian sense. 2 Natural law is contrasted with the law observed by all nations; e.g., it is said that by nature all men are free, and that slavery has been introduced by the law of nations. This is the Stoic conception of natural law. 3 Sporadically the Epicurean idea appears, as when it is said that buyers and sellers have a natural right to overreach one another as regards price. 4 Ulpian has a theory which seems to have been peculiarly his own, but to which Justinian gave a factitious importance by including in his *Institutes* Ulpian's definition: "Natural law is that which nature has taught all living things." The illustrations, which refer to rudimentary family life, are rather biological than legal. Although the Roman jurists referred to the law of nature for the interpretation of their own law, and even drew from it supplementary rules where their own law was silent, they referred far more frequently, and for the same purposes, to "natural reason" and to "equity", and they never ascribed to the law of nature such authority as to question the validity of a Roman rule because it was not in accordance with natural law. See CIVIL LAW; *JUS GENTIUM*, *JUS NATURÆ*.

Mediæval Theories. The doctrines of Aristotle and of the Roman jurisprudence were generally accepted in the Middle Ages as authoritative, and many attempts were made to reconcile them. There was a marked tendency to identify natural law with the law of God. In the *Decretum* of Gratian it is declared that natural law is identical with the Golden Rule. Thomas Aquinas divided all law into four classes—eternal, divine, natural, and human. The eternal law is the controlling plan of the universe, existing in the mind of God. A part of this eternal law has been directly revealed to men; this is the divine law. Another part is discerned by human reason, this is natural law. Except in its fundamental principles, natural law is not immutable, for "it seems to be natural to the human reason that it comes gradually from the imperfect to the perfect." Human law is the application of natural law to particular conditions. The practical influence of these theories upon the development of European law during the Middle Ages was slight. In the development of the English common law, as in the development of the Roman Imperial law, appeals to natural reason were far more frequent than appeals to natural law. In England, however, as well as on the Continent, the general law merchant, which was *jus gentium* in the Roman sense, was recognized as natural law.

Modern Theories. *Natural Law as a Factor in Legal Reforms.*—The general effect of the Protestant Reformation was to free the conception of natural law from ecclesiastical associations and limitations and to reemphasize its rational character. Natural-law theories became

effective factors in the reform of the law. In the seventeenth century natural law was treated as a source of international law, and many rules which had not yet become rules of international custom attained this position through the writings of Grotius, Pufendorf, and others on "the law of nature and of nations." Later during the eighteenth century and the earlier years of the nineteenth, when the great national codes of civil and criminal law were drawn up in Prussia, Austria, France, and other countries, natural-law theories helped to give the legislators a more independent attitude towards established law and custom. In England utilitarianism played a similar part in facilitating law reform.

Natural Rights as the Basis of Political Revolution—The theory of Cicero and of Thomas Aquinas, that laws in conflict with natural law are not truly laws, developed its revolutionary (not to say anarchistic) possibilities when the interpretation of natural law passed from secular and ecclesiastical authorities to the people at large. The theory that the popular consciousness is the true interpreter of that natural law by which all rulers are bound, found frequent expression before the close of the Middle Ages—e.g., in the writings of Marsiglio of Padua. With the Protestant Reformation these theories became practical forces in matters religious and political, and the tendencies which they represented first obtained a temporary triumph in England under the Commonwealth. Those legal rights which Englishmen had succeeded, through centuries of conflict, in asserting against the crown were brought by the Levelers into connection with the natural-law theories of the Continent, and thenceforth the rights of the individual to life, liberty, and property were "natural" rights. To these were soon added the right to participate in the constitution of government. As formulated by Locke and reformulated by Rousseau, these natural-right theories legitimized the revolutions which established the modern constitutional state.

Reaction against Natural-Law Theories—The first noteworthy philosophical reaction against the revolutionary natural-law theories was that of Hobbes (q.v.). Equally hostile to natural-law theories was, especially at the outset, the historical school of jurisprudence. The conception of law as a product of historical evolution in each nation led to the assertion that there could be no such thing as eternal or universal law. With the development of comparative study, however, it is again perceived that beneath all the diversity of national laws there is a substantially uniform element which may be called human or universal or natural. This natural law, however, is substantially the *jus gentium* of the Romans or the "natural justice" of Aristotle, and not the natural law of the Stoics or of the Middle Ages, for it is not discerned by reason, it is rather revealed by the conduct of the human race.

The doctrine of a natural law, or law of nature, underlying all positive law and resting upon fundamental human morality, has played an important part in the development of actual legal institutions. Though seldom referred to under that name in English and American legal decisions, it has, under the name of the law of reason or common sense, profoundly influenced the course of our legal development. See JURISPRUDENCE, JUSTICE, LAW.

NATURAL RIGHTS. See NATURAL LAW.

NATURAL SELECTION. The evolution idea is as old as the time of the Greek philosophers, but that form of it called natural selection, or Darwinism, dates from 1858, when the theory was stated by Darwin (q.v.) and also by Wallace (q.v.), each independently of the other. Nearly a century earlier Buffon, and afterward Erasmus Darwin, had suggested that species were mutable, and that all living beings had descended from some primitive type or germ, the transformation having been effected by changes of climate, food, exercise, and so on. But the real founder of the modern theory of organic evolution was Lamarck (q.v., see also LAMARCKISM). The chief agents or factors of organic evolution which he proposed were changes of environment, of climate, soil, food, temperature, use, and disuse, while he briefly mentions the agency of competition, the results of geographical isolation, and the swamping effects of crossing, besides use inheritance. Although supported by a few though well-selected facts, Lamarck's views were, owing to the influence of Cuvier and the deep-seated prejudice of the times, ignored and well-nigh forgotten, except to be called up and ridiculed. Yet between the date of Lamarck's death in 1829 and shortly before 1858 nearly 30 naturalists, most of them of eminence, had publicly enunciated in a tentative way evolutionary views—among them Grant, Wells, Naudin, D'Halloy, Schaaffhausen, Wallace in 1855, and others. Meanwhile Hutton and Lyell had advanced uniformitarian views in geology. Progress in the knowledge of the flora and fauna of the earth had greatly increased. The cell doctrine had been advanced, the sciences of paleontology, embryology, and morphology had been founded and were rapidly gaining ground.

As early as March, 1852, Herbert Spencer, in an essay published in the *Leader*, advocated the theory of the modification of species by changes of environment, and a few years later adopted the word "evolution," applying it to psychology and later to sociology and comparative religion.

History of the Rise of the Selection Theory. Such was the state of certain isolated scientific and philosophic minds, though the rank and file of naturalists were either indifferent or opposed to the theory of descent, when in 1858 the preliminary essays of Darwin and of Wallace were given to the public. Their views, which were destined to give such a decided impulse to biological inquiry, were independently confirmed by several biological experts after years of experience and research in all parts of

the globe. The botanist Sir Joseph D. Hooker, when surgeon and naturalist of the *Erebus* in the Antarctic expedition under Sir John Ross, published a flora of New Zealand, a *Flora Antarctica*, and in 1859 published his *Introduction to the Flora of Australia*, in which he advocated the selection theory. Before this (1858) Wallace had spent four years on the Amazon, and afterward eight years in the East Indian Archipelago, making large collections and careful observations. Meanwhile Charles Darwin, as the naturalist of the *Beagle* for nearly five years (1831-36) during her voyage around the world, was constantly exercising his marvelous powers as an observer. What chiefly led him, as early as 1839, to begin to favor the theory of descent, were his observations on the fossil mammals, the colossal armadillos and sloths, and the like, of South America, which appeared to be the ancestors of the degenerate forms now living; also the occurrence of local species on each of the Galapagos Islands, which he found to be very similar to those of the South American coast and yet slightly different. The result was that after 20 years of observations, experiments in his garden, and reflection, he elaborated the theory of natural selection.

On the first of July, 1837, he opened his first notebook to record any facts bearing on the origin of species, but "did not become convinced that species were mutable until two or three years had elapsed." More than a year after (October, 1838) he says: "I happened to read for amusement Malthus on *Population*, and being well prepared to appreciate the struggle for existence which everywhere goes on from long-continued observations of the habits of animals and plants, it at once struck me that under these circumstances favorable variations would tend to be preserved, and unfavorable ones to be destroyed. *The result of this would be the formation of new species*." It is worthy of notice that Malthus was the father of natural selection, that the *Essay on Population* was the source of inspiration of both Darwin and Wallace, and that to this fact is apparently due the exact similarity in, or coincidence of, their views. Darwin's preliminary essay, together with that of Wallace, who also had read Malthus's *Essay on Population* containing nearly identical selection views, was published in 1858. In the following year appeared Darwin's epoch-making *Origin of Species*. His theory was at once accepted by Canon Tristram, Lyell, Hooker, Bates, Huxley, and others in Great Britain; in the United States of America by Asa Gray and Jeffries Wyman, and in Germany by Haeckel, while Fritz Muller, working on the same lines in Brazil, fully accepted and extended his views. That the time was ripe for the development and growth of the evolutionary idea was proved by its speedy and general acceptance by nearly all working naturalists and thoughtful minds. Moreover, the selection phase was easy to understand by laymen, and soon the multitude accepted the new views.

The Natural-Selection Theory Explained. The theory of natural selection is based on the facts of variation. As to the causes of variation, Darwin does not say much in the *Origin of Species*. Basing his theory on the fact that variations are constantly and spontaneously arising, he claimed that the favorable variations have succeeded in the struggle for exist-

ence, while those unfit or unfavorable have perished.

He also remarked that, as long as the conditions of life remain the same, we have reason to believe that a modification which has already been inherited for many generations may continue to be inherited for an almost infinite number of generations. We are also told that, as each land had undergone great physical changes, we might have expected to find that organic beings have varied under nature in the same way as they have under domestication. "And if there be any variability under Nature, it would be an unaccountable fact if natural selection did not come into play." "If, then," he asks, "animals and plants do vary, let it be ever so little or so slowly, why should we doubt that the variations or individual differences which are in any way beneficial would be preserved and accumulated through natural selection, or the survival of the fittest? If man can by patience select variations useful to him, why, under changing and complex conditions of life, should not variations useful to Nature's living products often arise, and be preserved or selected? What limit can be put to this power, acting during long ages and rigidly scrutinizing the whole constitution, structure, and habits of each creature—favoring the good and rejecting the bad? I can see no limits to this power, in slowly and beautifully adapting each form to the most complex relations of life."

Geometrical Ratio of Increase of Organisms. "A struggle for existence," says Darwin, "inevitably follows from the high rate at which all organic beings tend to increase." There is a vast destruction of seeds, eggs, embryos, and young. Were this not the case the earth would soon become covered with the progeny of a single pair. Linné pointed out that an annual plant producing two seeds only—and there is no plant nearly so unproductive as this—and these each producing two in the following year, and so on, would in 21 years produce over 1,000,000 plants. The elephant is regarded as the slowest breeder of all known animals, yet a single pair would become in the course of about seven and a half centuries, if all lived to the close of the breeding age, the ancestors of nearly 19,000,000 elephants.

The rate of increase of an animal, each pair producing 10 pairs annually, and each animal living 10 years, is shown in the following table, copied from Marshall's Lectures

YEAR	Pairs produced	Pairs alive at end of year
1	10	11
2	110	121
3	1,210	1,331
4	13,310	14,641
5	146,410	161,051
10		25,937,424,600
20		Over 700,000,000,000,000,000,000

Immense numbers of eggs are laid by certain animals, and yet there are probably no more individuals now than centuries ago, the number of individuals remaining as a whole stationary. The queen bee lays during her whole life 1,000,000 eggs, the conger eel is estimated to deposit 15,000,000, the oyster from 500,000 to 16,000,000, and a very large oyster may produce even 60,000,000 eggs. "Supposing," says Marshall,

"we start with one oyster and let it produce 16,000,000 eggs, the average American yield, and let half, or 8,000,000, be females and go on increasing at the same rate, in the second generation we shall have 64 millions of millions of female oysters. In the fifth generation—i.e., the great-great-grandchildren of our first oyster—we should have 33 millions of millions of millions of millions of millions of female oysters. If we add the same number of males we should have in all $66 + 33$ naughts. If we estimate these as oyster shells we should have a mass more than eight times the size of the world."

Darwin also claimed that natural selection "acts solely by accumulating slight, successive, favorable variation," and can produce no great or sudden modification. It can act only by short and slow steps, hence "the canon of *Natura non facit saltum*, which every fresh addition to our knowledge tends to make truer, is on this theory intelligible."

Use and Disuse. Darwin in some cases admits the action of use and disuse. In both varieties and species, he says, use and disuse seem to have produced a considerable effect. His examples are blind cave animals, the burrowing South American *tuco tuco*, which is occasionally blind, and certain moles, also the loggerheaded duck, which has wings incapable of flight, in nearly the same condition as in the domestic duck. Instincts he regards as having been slowly acquired through natural selection. See *USE INHERITANCE*.

The Geological Record. He then dwells on the geological record, which, although it is very imperfect, nevertheless strongly supports, he claims, the theory of descent with modification. The extinction of species and of whole groups of species almost inevitably follows from the principle of natural selection, for old forms are supplanted by new and improved forms. The fact, he says, that the fossil remains of each formation are in some degree intermediate in character between those in the strata above and below, is simply explained by their intermediate position in the chain of descent. The grand fact that all extinct beings can be classed with all recent beings naturally follows from the living and the extinct being the offspring of common parents. Species have generally diverged in character during their long course of descent and modification, and thus the more ancient types are in some degree intermediate between existing groups. Recent forms are more improved and generally more specialized than the earlier ones. Yet certain forms have retrograded, while others have retained "simple and little-improved structures," being what are called persistent types.

Geographical Distribution. The facts of geographical distribution are also utilized by Darwin, who calls attention to the past migrations of animals from one part of the world to another owing to former climatic and geographical changes. They also explain why on the same continent under the most diverse conditions most of the inhabitants within each great class are plainly related, the reason being that they are the descendants of the same progenitors and early colonists. They explain why oceanic islands are inhabited by only few species, most of these, as those of Madagascar, being peculiar or endemic species. Moreover, the existence of closely allied or representative

species in any two areas, as Europe and North America, implies that the same parent forms formerly inhabited both areas. It is also the rule that nearly all the inhabitants of islands have been derived from ancestors which lived on the nearest mainland. Thus, the plants and animals of the Galapagos Archipelago, of Juan Fernandez and the other American islands, are closely related to those of the neighboring American mainland, while those of the Cape Verde Archipelago and other African islands were derived from the opposite African coast.

Facts of Morphology, Embryology, the Doctrine of Homologies. These were also drawn upon by Darwin. He maintained that adaptive characters, though of paramount importance to the beings, are of hardly any importance in classification, while vestigial characters are often of high classificatory value, the most valuable of all often being embryological characters. "The real affinities of all organic beings, in contradistinction to their adaptive resemblances, are due to inheritance or community of descent."

Natural Selection not the Exclusive Means of Modification. It should be observed that Darwin frankly expressed the conviction that natural selection, though the most important, has not been the exclusive means of modification. He allowed that absence of eyes in cave animals is not the result of natural selection, saying "I attribute their loss wholly to disuse."

The Causes of Variation. In the first edition of his *Variation of Animals and Plants under Domestication* Darwin, after defining the definite action of the environment, added "A new subvariety would thus be produced without the aid of natural selection," but this passage was omitted from the second edition. Besides the *Origin of Species* Darwin published a number of other works, the most important of which was *The Variation of Animals and Plants under Domestication* (1868). Towards the end of his life he gave more attention to the causes of variation, which at first he said were unknown, and in the work just cited he says "Changes of any kind in the conditions of life, even extremely slight changes, often suffice to cause variability" (2d ed., ii, p. 258), and again: "Variations of all kinds and degrees are directly or indirectly caused by the conditions of life to which each being, and more especially its ancestors, have been exposed," adding "To put the case under another point of view, if it were possible to expose all the individuals of a species during many generations to absolutely uniform conditions of life, there would be no variability" (ii, pp. 253, 255-256). He attributes the differences in races of cats living in Paraguay, at Mombasa, East Africa, and in Antigua, "to the direct action of different conditions of life" (i, p. 49), so with the horses of the South American pampas and of Puno. He refers to Dr. J. A. Allen's conclusions relative to the direct action of the climate in producing geographical varieties of birds, and concludes that "these differences must be attributed to the direct action of temperature" (ii, p. 271). So also, accepting the results of Meehan's comparisons on the leaves of 29 kinds of American trees with their nearest European allies, Darwin candidly admits that "such difference cannot have been gained through natural selection, and must be attributed to the long-continued action of a different climate" (ii, p. 271).

The objections to his theory raised by Darwin himself he discusses with his usual candor. Of these the most important is the absence, to use his own words, of the "interminable number of intermediate forms" which must have existed, "linking together all the species in each group by gradations as fine as are our present varieties." He says he can only answer this objection "on the supposition that the geological record is far more imperfect than most geologists believe." The other objection is the existence of two or three castes of worker or sterile ants in the same community.

Status of Darwinism at the Present Day. Such are the views of Darwin, as published in his *Origin of Species*. Although he pushed the special form of evolution to what one would suppose to be its furthest limits, yet as we have seen he somewhat modified his views later in life. The views of probably a large proportion of the moderate Darwinians at the present time have been expressed in a broad and candid way by Romanes, an able and careful commentator and expounder of the doctrine of natural selection. In his *Darwin and after Darwin* (1892), the most clear and readable exposé of the doctrine, the doctrine is thus stated. All plants and animals are perpetually engaged in the struggle for existence. This strife consists in the fact that in every generation of every species a great many more individuals are born than can possibly survive. Now, nature "selects the best individuals out of each generation to live." "And not only so, but, as these favored individuals transmit their favorable qualities to their offspring according to the fixed laws of heredity, it further follows that the individuals composing each successive generation have a general tendency to be better suited to their surroundings than were their forefathers. . . . And this follows not merely because in every generation it is only the 'flower of the flock' that is allowed to breed, but also because, if in any generations some new and beneficial qualities happen to arise as slight variations from the ancestral type, they will (other things permitting) be seized upon by natural selection, and, being transmitted by heredity to subsequent generations, will be added to the previously existing type." At the present day an increasing number of evolutionists do not regard natural selection as an active cause, but rather as the result of the action of a number of other agents, comprising the Lamarckian factors of change of environment, use, disuse, isolation, and so on. Undoubtedly, as the result of competition, animals have been driven to migrate, to adopt new habits, and thus to undergo modification. Many agree with Herbert Spencer as to the inadequacy of natural selection to account for the origination of new forms. From probably one-third to nearly one-half of the species of plants and animals now existing are climatic, local forms, resulting from the direct action of changes in the conditions of life, such as climate, soil, food, and the like. The great number of species of parasitic animals are the result of the young adopting a fixed or a more or less stationary mode of life. Natural selection is inoperative in the case of blind or eyeless cave and deep-sea animals.

Objections to Natural Selection. The objections now being urged to the special doctrine of natural selection are that, (1) to use Herbert Spencer's word, it is 'inadequate'. (2) the

favorable variation may be destroyed by the swamping effects of crossing; (3) natural selection is not analogous to artificial selection; nature is continually eliminating monstrosities, sports, variations, instead of preserving them; they are constantly being bred out in wild plants and animals, or those living under natural conditions of existence. The otter or ancon sheep, which under the breeder's care and watchfulness became a peculiar variety, when permitted to mingle or cross with normal sheep became extinct. Natural selection accounts for the preservation rather than the origination of new or incipient forms and structures. For the causes of variation, it is maintained, we must look to the action of the primary factors of organic evolution, viz., to the effects of changes in light, temperature, heat, moisture, dryness, altitude, food, and so on.

(4) It is not necessarily the fittest or most useful structures or individuals which survive. Carnivorous animals in seizing or swallowing immense numbers of eggs, embryos, and adult animals do not select this or that individual, but, on the contrary, old and young, the fit and the unfit, weak and strong, are engulfed in the maw of the whale as it swims through a shoal of minute crustacea, or hundreds of small fishes are indiscriminately, without reference to their fitness, swallowed by sharks. So with aphides existing in hundreds of thousands on some tree, the birds, like old Time of the New England Primer, indiscriminately pick off "all, both great and small." This matter of the survival of the fittest and the extinction of the unfit has perhaps been somewhat exaggerated, although it is granted that competition acts unceasingly in the biological environment.

(5) Darwinians acknowledge, as does Wallace in his *Darwinism*, that no one ever saw a species originated by natural selection. Weismann has frankly affirmed that "it is really very difficult to imagine this process of natural selection in its details, and to this day it is impossible to demonstrate it in any one point." (*Contemporary Review*, 1893, p. 322.) Yet a number of temperature species, races, or breeds have been experimentally produced by changes of temperature. The cases of seasonal dimorphism existing in nature have been exactly paralleled by variations in moths and butterflies subjected in the pupa state to cold or to extreme heat; and dry-season and wet-season as well as summer and winter forms have been produced artificially, besides other variations supposed to be extinct phylogenetic species.

(6) The view peculiar to Darwinism is that some individual variation was nursed and preserved, while all the others less favorable died. Some naturalists claim that the better-founded view is that of Lamarck, that the changes of environment simultaneously affected great numbers of individuals in a given region, which became modified by changes of climate, and so on, en masse. This certainly appears to be the case in local, insular, or geographical races, varieties, or species. What affects one affects all the individuals in a given area isolated by mountain barriers or other natural boundaries. Where natural selection appears to act is in the case of protective mimicry. The initial causes are changes in the amount of light, of shade, heat, and other physical agents, yet natural selection appears to be operative in bringing out the wonderful cases of mimicry

so well known. (See MIMICRY.) While therefore the Neo-Lamarckian readily acknowledges that natural selection results after new variations have arisen, there are those who, like the Rev Mr Henslow, maintain that in the case of seedlings natural selection is not concerned in bringing about the survival of the fittest, adding "A seedling survives among others solely because it is vigorous." He claims that as soon as a large number of seedlings appear aboveground, "natural selection at once steps in, so to say, with the result that all those with too weak a constitution to maintain themselves fail to withstand the struggle for existence and to come to maturity, the stronger plants only proving themselves the best fitted to survive." This process of selection, however, is quite independent of any modifications in morphological structure, by which 'varieties' or subspecies are alone recognized." The fact that the majority of offspring always perish in infancy he calls "constitutional selection."

(7) Darwin expressly regarded most variations as indefinite, chance, fortuitous, spontaneous, or promiscuous, "survival of the fittest," as Romanes expressed it, "becoming the winnowing fan, whose function it is to eliminate all the less fit in each generation, in order to preserve the good grain, out of which to constitute the next generation. And as this process is supposed to be continuous through successive generations, its action is supposed to be cumulative, till from the eye of a worm there is gradually developed the eye of an eagle." Other variations Darwin called "definite." In the chapter of his *Variation of Animals and Plants under Domestication* entitled "Direct and Definite Action of the External Conditions of Life" he says "By the term definite action, as used in this chapter, I mean an action of such a nature that, when many individuals of the same variety are exposed during several generations to any particular change in their conditions of life, all or nearly all the individuals are modified in the same manner." This appears to be practically the same view as that which was advanced by Lamarck and which is called by Eimer "orthogenesis" (q.v.).

Variation as the result of changed conditions is in nearly every case—perhaps four-fifths of all that occur, thus leaving very little scope for the play of chance or fortuitous variations—due to causes of which we are ignorant. Fortuitous variations, in fact, are an almost negligible quantity. Hence the primary postulate of natural selection that variations are in general fortuitous is in the nature of an assumption and not based on observed facts. As the result of recent investigation we are coming more and more to the view that variation in general is the result of the action of changed conditions of life, conditions both physical and biological, and that natural selection is not an active agent.

(8) Since Darwin called attention to the lack of long series of intermediate links between species, naturalists have been more and more inclined to the belief that such series of connecting variations have never existed, but that nature makes leaps, that species often arise by sudden or quick or saltatorial evolution. Certainly neither in the Paleozoic or later strata nor at the present time do we observe these series of minutely graduated numberless antecedent forms postulated by Darwin, there

still being gaps between the known connecting links. Hyatt, W. H. Dall, Galton, De Vries, and many others have advocated the view of the rapid or sudden modification of structure involving the sudden appearance of species, especially in Paleozoic times. This is seen by the results of the examination of the Steinheim forms of *Planorbis* and of the Tertiary forms of Austrian *Paludina*, where there are often wide gaps even between the connecting links. The new species of evening primrose raised by De Vries originated suddenly, without preparation or intermediate forms. (See MUTATION.) In the great variations observed by C. C. Adams in the forms of the fresh-water snail *Io*, peculiar to the upper tributaries of the Tennessee River above Chattanooga, the variations are evidently due to the varying nature of the bottoms of the streams, the rapidity of the current, and the forced isolation of the varieties, the different forms, from smooth to very spiny, being closely correlated to the varying nature of each stream and different sections of each stream from the headwaters to the mouth. In this case there is apparently no action of natural selection, but a direct response to the environment, and the gaps may thus be either marked or slight. In the hundreds of subvarieties of *Helix nemoralis* the gaps or intervals between such forms are distinct and well marked.

(9) Natural selection is manifestly inadequate to account for the origin of the principal types or classes of plants and animals. They must have appeared with comparative suddenness, as the result of changes of the conditions of life, inducing new needs, new habits, and the origin by exercise of new organs. Thus the types of coelenterates, echinoderms, crustacea, flying insects, amphibia, reptiles, birds, and mammals were the result of the action of the changed environment, of effort, use, isolation, and heredity, at a time when the ancestral forms were more plastic than their descendants.

(10) Natural selection, it has been claimed, could not have begun to act until the earth had become sufficiently well stocked with plant and animal life to afford materials for competition and survival of the fittest. The first forms of life must have arisen through the operation of the Lamarckian factors. In conclusion it may be said that it still remains an open question whether natural selection is an active or by any means universal agent in evolution. Finally it may be observed that the processes of evolution are in kind like those of simple growth of the individual organism and due to the same factors, and as in ontogenesis there is no one predominant factor, so in phylogenesis there is no one predominant factor, no prepondering mechanism such as has been ascribed to natural selection. In the opinion of some expert working naturalists the greater number of known species have been produced without its aid. It is not of the same nature as artificial selection. Yet the theory is widely accepted, and by its aid Darwin converted the world to a belief in evolution in general.

The views widely accepted as to the relation of natural selection to the other factors of organic evolution may be tabulated thus:

I. Primary factors.

Direct.—Changes of cosmical environment, changes of climate, light, darkness, temperature, dryness, humidity, physical and chemical constitution of the soil and of

waters, mechanical state of the *milieu*, winds, currents of water, biological environment, food, competition, parasitism, symbiosis.

Indirect—Reaction against cosmical environmental conditions; adaptation, convergence, reaction against biological conditions, mimicry.

II. Secondary factors.

Heredity, vital concurrence, natural and sexual selection, segregation, geographical isolation, amixia, hybridity

For bibliography, see EVOLUTION.

Germinal Selection. This doctrine, founded by Weismann, is an extension of the general idea of natural selection. To superorganic selection, ordinary individual or personal selection, Roux's theory of histological (histonal) or intracellular struggle for existence, Weismann has added the idea of a struggle among the hypothetical determinants within the germ, or germinal selection. J. A. Thomson has indicated the importance of a form of struggle lying between Roux's histonal selection and Weismann's germinal selection, viz., the struggle between gametes or potential gametes, e.g., between young ova, between sperms, even between ova and sperms. "A vivid realization of this visible struggle," says Thomson, "and the sometimes discriminate selection which it implies, may lead naturally to an appreciation of germinal selection, which deals with the wholly invisible." Although opinions may differ as to the existence of this hypothetical phase of selection, the writer just quoted claims that the theory "justifies itself provisionally as a formula unifying a large number of otherwise unrelated facts of inheritance."

NATURAL THEOLOGY. The systematic arrangement of that knowledge of the being and attributes of God which may be derived from the consideration of nature and reason. It has had, especially in English thought, two meanings, a wider and a narrower. The first does not differ greatly from what is now called the philosophy of religion. It is the application of the critical principles of science to the assumptions and phenomena of religion. The narrower meaning is the proof of the existence and character of God as shown by the contemplation of nature and especially by the argument from design. This has been the particular meaning of the term for the last century in English theological literature. For all the thought of the Western world the beginnings of natural theology lie in Greek philosophy. Socrates, Plato, and Aristotle taught the existence, the benevolence, and the unity of God by means of the study of nature and human life. The term, however, comes from the Stoics. Augustine (*De Civitate Dei*, vi, 5-12) quotes it

from Varro (q.v.). Augustine himself was not averse to the use of reason in the study of the nature of God, as his *Soliloquies* prove. With the Renaissance there was a return to this phase of thought. The first Christian book with this title was the *Theologia Naturalis* of Raymond de Sabunde (1483), which asserts that the revelation in the book of nature is clearer than that in the book of Scripture, since it needs no priests for its interpretation, but only unassisted intelligence. In English thought the deists (see DEISM) first laid emphasis on the value of the study of nature as the basis for religion. They proposed it as a substitute for Scripture, but, as Bacon shows, the same study was already in use for the purposes of sustaining the Christian revelation. Natural theology, he says, "suffices to confute atheism, but not to inform religion." The work of the deists but served to increase attention to natural theology as a proof for Christianity. The Boyle lectures, and later the Bridgewater treatises, were used for this purpose. The greatest book in English on the subject was Paley's *Natural Theology* (1802). This was largely devoted to an argument for the existence of God from the evidences of design in nature. It served as a model for many other books until the statement of the principle of evolution compelled the abandonment of arguments which were based on the conception of God as a skillful mechanic. In America the rationalizing spirit of the New England theology (q.v.) led it to lay much weight upon natural theology, and it was generally made the basis of the system of theology by theologians of this school and by most others during a large part of the last century. The arrangement of topics was usually somewhat as follows: beginning with the principle of causation, which was established as a necessary truth, then followed the arguments for the existence of God, predominantly or exclusively the a posteriori arguments, for a contriver, governor, creator, preserver, and moral governor. The natural attributes of God were deduced, then His moral attributes. The benevolence of God having been proved, the argument could advance to the Scriptures, the inspiration of which was proved by the need of man for revelation and the certainty that a benevolent God would supply so grievous a need. Of late years, largely under the name of the philosophy of religion, a broader and more profound view of the world has produced what in time will be a new natural theology, in the recognition that nature and the course of human history present what may properly be called a revelation of the character of that Final Cause which reason must assume to lie behind the universe.

Webb, *Natural and Comparative Religion* (Oxford, 1912); Newman Smyth, *Constructive Natural Theology* (New York, 1913).

NATURAL TONES. A musical term applied to those tones of wind instruments that are produced, without altering the length of the tube (by valves or slides), by increased or diminished force of the air current. The tones thus produced are always overtones of the fundamental tone. But this fundamental tone can be produced only upon instruments having a wide bore in proportion to their length, like the tuba or trombone, whereas the fundamental cannot be produced upon the trumpet, which, consequently, yields only the higher overtones as natural tones. See HARMONICS. Consult E. Ergo, *Dans les propylées de l'instrumentation* (Antwerp, 1908).

NATURE PRINTING. A process by which engravings or plates are reproduced by taking direct impressions of the objects themselves, and printing from them. The process was invented in 1849 by Alois Auer, director of the state printing establishment of the Austrian Empire, and, though very simple, it cannot be applied to any objects except those with tolerably flat surfaces, such as dried and pressed plants, embroidery and lace, and a very few animal productions. The object is placed between a plate of steel and another of lead, both of which are smooth, and polished. They are then drawn through a pair of rollers under considerable pressure, and when the plates are separated it is found that a most beautiful and perfect impression of the object has been made in the leaden plate. This may be used directly as an engraved plate, if only a very few impressions are wanted, but it is too soft to resist the action of the presses for practical purposes: a fac-simile to be used as the printing plate is made in copper by the electrotpe process. The inventor published a description of his work in 1854 at Vienna, in which is given a detailed account of the method.

NATURE STUDY. A modern development of the movement of elementary education towards the study of real objects rather than symbols. It arose in response to a demand voiced as early as the year 1845 in America by Horace Mann (q.v.) for early training in the inductive method of thought and in the field of nature.

According to generally accepted ideas on nature study, it must concern itself not only with the common living objects of the child's environment—these the child must be led to examine, to work with himself—but also with the study of lifeless objects and the elementary notions of physical science in so far as they are part of the everyday life of the child. The work must be carried on, so far as possible, to strengthen independence of thought and judgment. The beginnings of the study must be based upon the immediate surroundings of the child, and the field of inquiry may be extended further abroad as the later years of the school

are approached. The tasks in the earlier years should be chiefly observational. Nevertheless, the experimental method of study should not be neglected. As far as possible organic forms should be regarded as living things capable of activity and change, the point of view should therefore be dynamic—a matter of great pedagogic importance. The plan of the work may properly be made out so as to include the commoner animals and plants and the everyday phenomena of inorganic nature. Duplication of work should be avoided by increasing the difficulty of the problems and basing them on different material. It is better to study the materials comparatively as far as possible, so that pupils may learn to discriminate and to form general notions. The exhaustive study of one type is of much less value. Outdoor work should be done; in addition to gardening, studies of the habits and haunts of animals, the appearance and disappearance of the birds, the relations of insects to plant life, the appearance of trees in summer and winter dress, and numerous other similar topics may form the basis of study. It is also considered desirable so far as possible to correlate the studies of animals with the studies of physiology and hygiene, especially in its application to human needs. Another subject with which nature study has more recently been connected is geography. It is highly important that the materials should be abundant, that the teacher be not too closely tied to a detailed plan of work, and that he be resourceful in the matter of making the most of what is available.

Nature study as a school subject has been promoted in England by the School Nature Study Union, organized in 1903, and in the United States by the American Nature Study Society, established in 1908.

NATURE WORSHIP. The worship of all things in nature, including the elements, celestial bodies, plants, animals, and man.

Facts of Nature Worship. The worship of the elements does not seem to occur in the most

primitive religions: in later stages, however, the elements often become the objects of religious regard. Mother Earth has been worshiped by many peoples, the winds are revered even in relatively primitive society. The east wind, a malevolent god among the modern Hindus, was a beneficent Mexican deity. The Yukaghir distinguish 22 directions, all of which are sacrificed to. The worship of fire, not uncommon elsewhere, has reached its culmination in the cults of Mazdaism. Celestial bodies were deified in primitive as well as highly civilized communities. The Hottentots worship the moon and the dawn; sun worship was practiced by the ancient Iroquois, is found among the Indians of the Plains, the Tsimshian of the northwest coast of America, and reached a high state of development among the Mexicans and Peruvians. While even the primitive Australians address appeals to the sun and the lightning, the sun was also a Hindu deity; among the Dravidians it appears as a malignant demon, while it is deemed beneficent among the Munda: the Babylonians were sun worshippers, while in Persia the sun became the centre of the elaborate Mithra cult. The sun is represented in many religions, as in India, under the figure of a bull or horse or bird, or as riding in a car dragged by seven steeds, or as having rays. Sun and moon are the goal of souls in several religions, such as the Polynesian and Hindu. The Egyptians worshiped at the shrine of the sun god Re, they also deified the moon (identified with the Isis god Thoth) and Sirius (often identified with Isis). Among their deities were also the constellations, "the never-resting ones," and the circumpolar stars, "the imperishables." Important as the celestial bodies thus prove to be in worship and cult, they played an even more conspicuous rôle in mythology (q.v.), their precise position and functions in that vast domain having given rise to innumerable theories and speculations.

Stones were worshiped among the Lapps, Finns, African negroes, and South Sea Islanders. Among these sacred stones some are huge rocks, others have shapes suggesting animals or man, still others are heavenly stones. The latter were known to the Greeks and Romans and are still worshiped in many places. A special form of stone worship is fetishism (q.v.), a term more commonly applied to the worship of artificial objects. While Africa is recognized as the classic land of fetishism, the cult is not unknown elsewhere. Witness the animal fetishes of the Zuni. The medicine bundles of the Plains Indians are also practically fetishes. In central Australia, among the Aranda, we find the sacred stone *churinga*, associated with their totemism. As a modern survival of stone worship may be regarded the belief in the magic powers of precious stones.

Plants and trees are worshiped as totems, or because they are useful or beautiful or fearsome or symbolic of a sacred object or being. They may be holy in themselves or as dwelling places of spirits. The soma plant in India as well as the coca of Peru are worshiped for their intoxicating qualities. In northern Australia and parts of the Torres Strait islands and Melanesia plants often occur as totems. Many varieties of trees are held in veneration in India, such as the *karani* tree, the fig tree, the *sal* or *sakhu*, the yand tree, the mahwa, the cotton tree, coconut, mimosa, etc. The plants of the fields,

usually as harboring spirits of fertilization, were worshiped in primitive communities as well as by the peasants of Europe, among whom traces of these cults can still be found.

Primitive mentality draws no sharp line between man and animal. Among North American Indians, e.g., human qualities are constantly attributed to animals. Transmigration of human souls into animals was believed in in India and Egypt and among the South African Bantu and many other peoples. The mythological creatures of central Australian mythology are interchangeably animals and men. On the northwest coast, or among the Eskimo, men are believed to transform themselves into animals by putting on animal skins, similarly, animals become men by throwing off their skins. Animals are worshiped as ancestors in totemic communities and elsewhere. At Bubastis, in Egypt, where the cat-headed Bast was worshiped, vast cemeteries of mummified cats were discovered, similar cemeteries, dedicated to other animals, were found in other parts of Egypt. Animal taboos, involving various degrees of veneration for the tabooed animals, are practically universal in primitive society and survive, without the veneration, in modern culture. Animals as guardian spirits are indigenous in North America as well as in parts of Polynesia.

Of all animals the snake is perhaps the one most frequently adored. The snake appears to have been worshiped in every land, either as a soul receptacle or friendly house snake, in whose body resides the soul of an ancestor (as in Rome and India), or as a healing and mantic power of wisdom (as in the cults of Babylon and Greece), or as an evil spirit, world snake, or dragon. The negroes of Africa, the Dravidians and American Indians, the Mexicans and Peruvians, Egyptians, Greeks, Romans, and Semites regarded the snake in one or another of these forms as a divine animal. The dragon of the Eddas is evil, he is the Midgardswurm that embodies destruction, like the rain-preventing dragon *Vritra* of the *Rig-Veda*; but beside the latter stands the figure of the Dragon of the Deep, to whom the Vedic Aryan prays as to a beneficent divinity. So Apollo as a healing god is associated with *Esculapius'* snake, but destroys the Python. Among the Mongoloid Naga tribes, as among the Chinese, the dragon snake is a world divinity. Snakes are also often associated with phallic worship.

Man, finally, is revered as an ancestor or as a great chief or medicine man. The Romans had their divine emperors, the Egyptians their pharaohs. Priests and kings are divine in modern India, China, and Japan.

Theories of Worship. Max Müller and other writers of the naturalistic school of mythology posit the adoration of nature as a fundamental and primary fact. Nature, with its innumerable wonders, surprises, elemental forces, must even have aroused the respect, the awe, the adoration of primitive man. Taking so much for granted, Max Müller attempted to reconcile this primitive adoration of nature with the worship of personal deities such as he found it among the peoples of classical antiquity. Müller used a linguistic method of proof. A comparative analysis of many words belonging to the Indo-European group of languages, including their Sanskrit originals, led to the establishment of a set of primary words which, in turn, proved to be resolvable into a number of fundamental

primitive roots. These roots seemed to refer to actions such as walking, standing, sleeping, rising. Now, argued Muller, these were the only linguistic tools with which man, in those remote times, could operate. Hence, when the need arose to refer to the objects and powers of nature, which to him was of such great concern, man used these roots, although their meanings were saturated with human values and, in many instances, did not at all fit the processes of nature. In the course of time the use of a vocabulary born of human associations led to the personification of natural phenomena. It also occurred that one phenomenon in its different phases was designated by separate words. As an attempt to reconcile in imaginative tales these often contradictory designations, mythology arose. The most complete formulation of Max Müller's theory is contained in an essay on *Comparative Mythology* (1856), reprinted in his *Chips from a German Workshop*, vol. 11.

A radically different theoretical position was assumed by E. B. Tylor (*Primitive Culture*, 1871) and Herbert Spencer (*Principles of Sociology*, vol. 1, 1876). These two writers represent the main exponents of the doctrine of animism (q.v.). Their method of deriving and interpreting the primitive theory of spirits has been explained in another place. Here we shall note only the difference between Tylor's and Spencer's treatment of the subject in so far as the former, having arrived at the human spirit, proceeds to explain the origin of animal, plant, and nature spirits by an analogous argument, whereas the latter ignores the independent existence of all spirits other than human, conceiving the spiritualization of animate and inanimate nature as a process of extension of the idea of a human spirit. Spencer and Tylor agree in regarding the worship of the dead as the earliest religious cult. Further than that, however, Tylor does not go, his concern being with the history of the animistic faith from most primitive times up to the present day, rather than with the evolution of religious beliefs and rites. The latter task is undertaken by Spencer, who, positing ancestor worship (q.v.) as the earliest form of religion, proceeds to derive from it all other forms of cult and worship. He suggests three processes which must have led to animal worship. Animals which haunt houses are readily conceived as possessed by the souls of the departed and will therefore be regarded as sacred. The same is true of animals often seen in the vicinity of graves. But the principal source of animal worship Spencer sees in a process designated by him as the misinterpretation of nicknames. Savages are wont to give each other animal names. Subsequently, when the ancestors of individuals are referred to in conversation by their animal names, a misunderstanding readily arises. The primitive mind does not easily distinguish between a name and the thing named, a crude and indefinite language, moreover, does not permit the savage to avoid or correct errors of understanding. Hence the animal-named ancestors soon come to be conceived as real animals, and as such they are worshiped. Even the ascription of human characteristics to animals, so common in primitive culture, Spencer explains as due to the fact that man and animal are believed to have had a common ancestor. When animal appellations begin to recede before an advancing culture, cases will occur where one of the ancestors will

be conceived as human, the other as animal. Thus arises the belief in and the worship of monsters with mixed human and animal traits. Still later, finally, when human names completely replace animal nicknames, ancestors no longer lose their true characters and are worshiped as human. The worship of plants and of inanimate nature Spencer explains on similar lines.

A systematic presentation of W. Wundt's position (*Volkerpsychologie, Mythos und Religion*, vol. ii) cannot be given here, but the main points of his system may be briefly summarized. The lowest layer of religious belief is constituted by a faith in souls, human souls. This, according to Wundt, is the most primitive form of animism. The belief in magic developed from the contact of man with those aspects of nature which strike him as strange, exceptional, frightful, awe inspiring, such as floods, storms, thunder and lightning, etc. While thus the belief in magic has its own psychological sources, it presupposes a preexisting animism without which it could not develop. The most primitive cult, also based on animism, is fetishism, the belief in particular powers exercised by specific, usually artificial, objects. Wundt regards fetishism as a universal stage in the development of religion through which all mankind must have passed. Another outgrowth of animism is totemism, which Wundt conceives as the most characteristic form of animalism, or animal worship, the totem appearing in two typical varieties, as ancestor and as guardian spirit. The second variety of totemism is a later form, which constitutes a link between animal worship and the worship of human ancestors, or manism. Thus Wundt shares Spencer's opinion that in the ancestral cult the animal preceded man. In Wundt's system, however, the worship of human ancestors constitutes a relatively late phase of religious development.

A recent highly original contribution to the theory of religion and worship we owe to Emile Durkheim (*La vie religieuse*, Paris, 1912). The French sociologist rejects all theories of religion which, in the last analysis, are based on illusions, such as dreams, the echo, etc. There must exist a reality, asserts Durkheim, from which all religion draws its source. The fundamental fact in religion is the division of experience into sacred and profane. The problem then consists in ascertaining the root of this dichotomy of experience. Durkheim bases his argument on an intensive analysis of totemism as found in Australia. He tries to show that totemism embraces all the elements characteristic of the higher religions and is therefore a true religion. Now, in the totemic complex of beliefs and practices, the worship is really directed, not to the totemic animals or the members of the clan or the totemic symbols, but towards a mysterious power, the totemic principle, which pervades all that is sacred, all else being profane. Durkheim identifies the totemic principle with mana, the magic power (see MAGIC), a belief which supersedes the totemic principle among tribes that have passed out of the totemic stage. An analysis, finally, of mana or the totemic principle leads to the discovery of the reality underlying religion. The savage, in Durkheim's case the Australian, is aware of two radically distinct cycles in his experience: on the one hand there is the monotonous round of everyday activities, on the other the exciting

and strange phenomena of ceremonial life. On ceremonial occasions the individual lives on a different plane, his emotions, thoughts, acts altogether transcend the level made familiar by daily routine. The individual feels himself actuated by a superior and irresistible power. Behind that power, although unrealized by the savage, is society, the clan, social pressure. Such, then, is the reality underlying religion, it is society itself, for the power by which the individual feels himself to be actuated becomes the source of the sacred.

Viewpoint of Ethnology. While all of these theories contain thoughts and suggestions of interest to the student of culture, not one can be accepted in its entirety. Recent advances in ethnological knowledge and important modifications in the methods of research have resulted in an attitude of extreme caution in all problems of origins and developments. Our conclusions also are less ambitious, if perhaps more reliable.

Müller's and Spencer's philological arguments have long since been discarded. While the comparative study of word roots is of inestimable value for tracing linguistic relationships and often proves a precious guide in the study of the migrations and contact of peoples, a theory of religion and mythology which represents religious emotion and mythological concepts as secondary developments based on linguistic processes is doomed to failure. Similarly, Spencer's theory of the misrepresentation of nicknames falls to the ground as soon as analyzed in the light of modern linguistic work among primitive peoples. The reconstruction of primitive languages, with their rich vocabularies and often enormously complex grammars, forbids all thought of misapprehension such as Spencer assumed to lie at the root of animal worship. Another tendency shared by Spencer with many writers of his day was one towards monogenetic explanations: all spirits are human in origin and become secondarily associated with animals, plants, inanimate objects, ancestor worship is the one primitive cult to which all later cults are more or less remotely related. Neither historical nor psychological considerations permit us to limit the origin of spirit and the origin of worship to one out of many possible sources. With reference to ancestor worship (q.v.), Wundt is certainly right as against Spencer in regarding it as a relatively late form of worship and rite, although a more primitive cult of the immediate dead seems to be rooted in the remotest antiquity. In Spencer's as well as in Tylor's presentation the process of development of religion appears as a distinctly individualistic and rationalistic one, they overlook the effect of the social setting on individual experience and entirely overestimate the importance of conscious intellectual processes in situations where subconscious and emotional complexes play the leading rôle. In this latter respect Wundt's work stands on a distinctly higher plane than that of his English forerunners. His treatment of the development of religious phases, on the other hand, remains highly schematic and must be rejected. We may not accept his fetishism and totemism as universal stages in the evolution of religion; nor has Wundt given satisfactory proof of his categorical assertion that animal ancestor worship must have preceded the worship of human ancestors. In Durkheim's system, finally, due attention is given to the

social setting; unfortunately, however, the author abandons one extreme for another and altogether disregards individual experience and initiative in his account of the origin of religious sentiment. (Consult A. A. Goldenweiser's review of Durkheim in the *American Anthropologist*, 1915.) Durkheim's identification of the totemic principle with *mana* (see MAGIC) runs counter to all ethnological evidence, while his attempt to derive the category of sacredness from the reaction of the individual consciousness to social pressure will scarcely be found to conform to either primitive or modern experience of religious phenomena.

Before closing it will be well to formulate a few general conclusions which seem justifiable at the present stage of our knowledge of the phenomena of worship. We must assume that the various forms of worship and rite have had a variety of historical and psychological origins, hence any attempt to derive all forms of religion from some one source, no matter how plausible logically or even psychologically, must needs fall far off the mark. The same is true of religious developments. In studying these we observe divergent and convergent phenomena, beliefs and rites, although genetically related, develop in different directions, resulting in highly disparate objective and psychological features, on the other hand, originally distinct lines of religious or ritualistic evolution converge towards forms which display considerable, sometimes great, similarities. Amid the maze of convergences and divergences striking parallelisms occasionally occur, although these never refer to phenomena that are highly complex or greatly extended in time. In innumerable instances the religious situation at a given place and time cannot be understood unless the contact of peoples is taken into consideration. While the social and, speaking more generally, the cultural setting is of paramount importance as a codeterminant of religious phenomena, the individual differences as well as the specific experiences of individuals must not be neglected if proper perspective is to be preserved. This applies with especial force to religion, as in this domain the rôle of individual initiative seems ever to have been particularly significant. While the current terms used for the designation of religious phenomena, such as god, magic, totemism, animal worship, etc., probably serve their purpose as well as any, one must ever remember that under any system of nomenclature highly heterogeneous complexes must needs be designated by the same terms; thus, totemism, e.g., is in North America colored by guardian-spirit ideas, whereas among the African Bantu it is related to the taboo concepts current among those peoples.

While modern insight thus tends to discourage sweeping generalizations or undue implications in dealing with the phenomena of religious worship, some forms of belief must certainly be recognized as bearing the marks of great primitiveness or universality or of both. Among these must be noted animism, the belief in souls and spirits, which certainly is as primitive as it is universal, the belief in magic power, which is as universal and probably as primitive as animism, the general human tendency to experience vague and undifferentiated but at least potentially religious emotions when coming in contact with striking phenomena of nature. Other phenomena of worship, on the other hand,

clearly do not belong to the most primitive religious manifestations and are also limited in their distribution. Among these we must include ancestor worship in general and the worship of human ancestors in particular. Here also belongs fetishism, the belief in particular powers associated with specific, usually artificial, objects. Fetishism, it seems, in part fuses with, in part is independent of, animism. Totemism, finally, must also be classed as a form of worship which is neither primitive nor universal, consisting as it does in an association of a particular form, or rather of several forms, of animal worship with a special form of social organization which has itself but a limited distribution and can certainly not be regarded as primitive. Animal worship, on the other hand, which, it will be seen, is by no means coextensive with totemism, is again a practically universal and probably fairly primitive form of belief. Identification of man and animal and transformation of one into the other are most characteristic traits of primitive belief. These identifications and transformations, the primary source of which must lie in the obvious physical and psychic similarities between man and beast, constitute the favorite theme of all mythologies.

NAUCK, nouk, JOHANN AUGUST (1822-92). A German classical scholar. He was born at Auerstedt and, after studying at the University of Halle, taught at several Gymnasiums at Berlin until about 1859, when he became member extraordinary of the Imperial Academy of Sciences at St. Petersburg. He remained in that city until his death. His best-known works are: *Aristophanis Byzantini Grammatici Alexandrini Fragmenta* (1848), a text edition of the complete works of Euripides, with the fragments (1854; 3d ed., 1871), *Studia Euripidea* (1859-62); an annotated edition of Sophocles (*Sophoclis Tragediae*), based upon Schneidewin (1867); Homer's *Odyssey* (1874) and *Iliad* (1877-79); *Iamblichus de Vita Pythagorica Liber* (1884), select works of Porphyrius, *Porphyrii Philosophi Opuscula Trium* (1860; 2d enlarged ed., *Opuscula Selecta*, 1886), and his greatest work, *Tragicorum Graecorum Fragmenta* (1856; 2d ed., 1889), with the *Tragicorum*

Dictionis Index, 1892). The last work is considered the standard edition. Consult J. Zieliński, *August Nauck* (Berlin, 1894), where his writings are enumerated, and J. E. Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

NAUCRATIS (Lat., from Gk. *Ναυκράτις*). An ancient city of Egypt, situated on the Canopic branch of the Nile, near the modern Nebfreh, 53 miles southeast of Alexandria by rail. The site was discovered in 1884 by Petrie. Under King Amasis II it was the only place in Egypt where Greeks were allowed to settle and trade, and thus became a very flourishing Greek colony. The most prosperous period of the city was from 570 to 525 B.C. The excavations, which centred chiefly about the sites of the temple of Apollo and Aphrodite, brought to light evidences of the other temples mentioned by Herodotus and Athenæus. Of particular interest is the material discovered bearing on the history of ceramics and epigraphy. On the successful excavations of Petrie, consult his *Naukratis* (London, 1886-87). Petrie thinks that the Greek settlements at Naukratis may date from as early a period as 650 B.C. Consult W. M. Flinders Petrie, "Naukratis I," and E. A. Gardner, "Naukratis II," in *Egyptian Exploration Fund, Publications*, vols. iii, vi (London, 1886-88); D. G. Hogarth, in *British School at Athens, Annual* (ib., 1898-99); id., "Naukratis, 1903," in *Journal of Hellenic Studies*, vol. xxv (ib., 1905).

NAUCYDES (Lat., from Gk. *Ναυκίδης*, *Naukydēs*), called OF ARGOS. A Greek sculptor of the fifth century B.C. He was trained in the manner of Polyclitus I and was the master of his brother Polychitus II. A Discobolus now in the Vatican is believed to be a copy of a work by him. A gold and ivory Hebe and statues of Hecate, Hermes, Erinna the poet, and some groups of athletes are mentioned by writers of his time and a later period as works of this sculptor.

NAUDET, nò'da', JOSEPH (1786-1878). A French historian, born in Paris. He was made professor of Latin poetry at the Collège de France in 1821 and was director of the Royal Library from 1840 to 1860. He was also a member of the Academy. His works include: *Histoire de la guerre des esclaves en Sicile* (1807); *Histoire de l'établissement, des progrès et de la décadence de la monarchie des Goths en Italie* (1811); *La conjuration d'Etienne Marcel* (1815); *De l'administration des postes chez les Romains* (1863).

NAUGATUCK, na'ga-tūk. A town and borough (coextensive) in New Haven Co., Conn., 5 miles south of Waterbury, on the Naugatuck River and on the New York, New Haven, and Hartford Railroad (Map: Connecticut, C 4). It has the Whittemore Memorial Library, the splendid Whittemore Memorial Bridge, spanning the river here, Salem School, Naugatuck High School, and noteworthy business blocks, and is engaged extensively in manufacturing India-rubber goods, knit underwear, malleable iron, copper goods, gas and electric fixtures, and paper boxes. Naugatuck was first incorporated in 1844 as a town, and in 1893 as a borough; consolidation was effected in 1895. The government, under the charters of 1893 and 1895, is administered by a board of warden and burgesses, annually elected, which has powers of appointment in all borough offices excepting the board of education, chosen by popular vote.

Pop., 1900, 10,541; 1910, 12,722, 1914 (U. S. est.), 13,651.

NAUHEIM, nou'him. A noted watering place in the Grand Duchy of Hesse, Germany, on a slope of the Taunus Mountains, at the foot of which flows the Usa, 17 miles north of Frankfurt (Map: Germany, C 3). The Kurhaus is surrounded by beautiful grounds. The waters, ranging in temperature from 86° F to 95° F. and containing salt, iron, and carbonic acid, are used for both drinking and bathing. Considerable quantities of water are exported. Cooking and bathing salt is extracted. The place is visited annually by about 34,000 patients. Pop., 1900, 4501, 1910, 5694.

NAULETTE, nò'lét'. 'A cavern on the Lesse in the Commune of Furfooz, near Dinant, Belgium. Here, in 1866, Dupont found a human lower jaw associated with bones of the elephant and rhinoceros. The Naulette man is now assigned to the Mousterian epoch. See PALEOLITHIC PERIOD.

NAUMACHIA, na-mă'ki-a (Lat., from Gk. *ναυμαχία*, naval battle, from *ναῦς*, *naus*, ship + *μάχεσθαι*, *machesthai*, to fight). Among the Romans, a mock naval battle, also the place used for this purpose. Julius Cæsar was the first to introduce a naumachia into Rome (46 B.C.), causing a portion of the Campus Martius to be transformed into a lake. Augustus made an artificial lake (*stagnum*) near the Tiber for the same purpose, which was afterward frequently used for naumachiae. Claudius also gave an exhibition of the kind on Lake Fucinus, in which 19,000 combatants took part. These naumachiae were not sham fights, any more than ordinary gladiatorial combats were sham contests. Both sides fought in real earnest until one was utterly overpowered. The crews consisted of gladiators, prisoners, or condemned criminals. Consult the article "Naumachia," in William Smith, *A Dictionary of Greek and Roman Antiquities*, vol. ii (3d ed., London, 1891), and Ludwig Friedländer, *Roman Life and Manners under the Early Empire*, vol. ii (7th rev. ed., New York, 1909).

NAUMANN, nou'man. A family of German musicians. **JOHANN GOTTLEB** (1741-1801), the most famous member, was born at Blasewitz, near Dresden. He studied under Tartini, Padre Martini, and others and became court composer at Dresden in 1764. In 1766 he was appointed kapellmeister at Dresden. He produced many operas and in 1777 organized the royal orchestra of Stockholm, Sweden. He made several tours throughout Italy and Prussia and was regarded as one of the most important composers of his time. He wrote over 20 operas, 10 oratorios, 18 symphonies, and numerous smaller works, instrumental and vocal. Consult. Meissner, *Bruchstücke aus Naumanns Lebensgeschichte* (Prague, 1803-04).—His grandson, **EMIL** (1827-88), studied under Von Wartensee and Mendelssohn and at the Leipzig Conservatory. He was chiefly famous for his valuable and scholarly writings, particularly with reference to Church music, and was also the composer of an oratorio, *Christus der Friedensbote* (1848), and the opera *Judith* (1848). Among his more important works are: *Die Tonkunst in der Kulturgeschichte* (Berlin, 1869-70); *Musikdrama oder Oper* (1876); *Illustrierte Musikgeschichte* (1880-85). He lectured on musical history at the conservatory at Dresden.—**KARL ERNST** (1832-), another grandson of Johann Gottlieb, became

favorably known for his writings and compositions. He was born in Freiberg, Saxony, and received his musical education in Leipzig, completing his musical studies with a two years' period of organ study under Schneider of Dresden. His compositions are principally chamber music, and so far as is known he may be said to have written the first sonata for viola and pianoforte.

NAUMANN, (JOSEPH) FRIEDRICH (1860-). A German publicist. He was born at Stormthal, near Leipzig, and was educated at Leipzig and Erlangen universities. In 1883-85 he was assistant at the Hamburg Rauhe Haus (reformatory) and from 1886 to 1890 was pastor at Langenberg. He held other posts as a clergyman, but in the middle nineties gave up the ministry, became a leader of the left wing of the Christian Socialist party, was one of the founders and first president of the National Socialist party, and edited *Die Zeit* (1896-1903; then coalesced with *Die Nation*), the political periodical *Hilfe* (1901-07), and an annual of the party called *Patria*. Heidelberg University gave him an honorary D.D. in 1903. He was elected to the Reichstag in 1907, but failed of reelection in 1912. Among his many books are: *Der soziale Progress der evangelischen Kirche* (1890), *Was heisst Christlich-sozial?* (1894-96), *National-sozialer Katechismus* (1896), *Weltpolitik und Sozialreform* (1898), *Flotte und Reaktion* (1899), *Demokratie und Kaisertum* (1900), *Kunst und Volk* (1902), *Briefe über Religion* (3d ed., 1904), *Neu-deutsche Wirtschaftspolitik* (1906), *Freiheitskämpfe* (1911); *Geist und Glaube* (1911).

NAUMANN, JOHANN FRIEDRICH (1780-1857). An eminent German ornithologist. He was born at Ziebigk, worked with his father, J. A. Naumann, also an ornithologist, and became professor and inspector of the ornithological museum of the Duke of Anhalt-Köthen. He was a clever draftsman and himself engraved the plates for the illustrations of his *Naturgeschichte der Vogel Deutschlands* (12 vols., 1822-44), a standard work. He was also a skillful taxidermist and mounted the best collection (of local birds) of his time. Naumann wrote, besides *Taxidermie* (1815, 2d ed., 1848), *Ueber den Haushalt der nördlichen Seevögel Europas* (1824); *Die Eier der Vogel Deutschlands* (1819-28), with Buhle. In honor of Naumann and his father the German Ornithological Society named its journal *Naumannia*.

NAUMANN, KARL FRIEDRICH (1797-1873). A German mineralogist and geologist, born in Dresden. He studied at the Freiberg School of Mines and at the universities of Jena and Leipzig and in 1821 made a journey to Norway for scientific purposes. After his return he became an instructor at Jena (1823). A year later he was called to be professor at Leipzig. During the period 1826-42 he held the chair of mineralogy and geognosy at Freiberg, then returned to Leipzig, where the last 30 years of his academic career were spent. Among his writings are: *Anfangsgründe der Kristallographie* (1841, 2d ed., 1854); *Elemente der theoretischen Kristallographie* (1856); *Elemente der Mineralogie* (1846; 14th ed., 1901).

NAUMBURG, noum'bŭrk, or NAUMBURG-ON-THE-SAALE. A town in the Province of Saxony, Prussia, situated on the Saale, 30 miles southwest of Leipzig (Map: Germany, E 3). Its

cathedral of Sts. Peter and Paul has four towers and many statues, paintings, monuments, and other specimens of early German art. Other noteworthy old buildings include the town hall and the castle. There are a Gymnasium and a Realschule. The town manufactures woollens, soap, leather, combs, stockings, brushes, toys, and ivory goods. Much sparkling wine and beer are produced. Glass and porcelain painting is also an important industry. In 1029 Naumburg became the seat of the bishopric of Naumburg-Zeitz. Pop., 1910, 26,962.

NAUNTON, nā'n-ton, SIR ROBERT (1563-1635). An English politician, born at Alderton, Suffolk. In 1582 he graduated B.A. from Trinity College, Cambridge, where he became a fellow in 1585 and public orator in 1594. He then traveled on the Continent, furnishing information on the political condition of Europe to the Earl of Essex, but resumed his duties of public orator in 1600. He became a member of Parliament for Helston in 1606, was chosen for Camelford in 1614, and represented the University of Cambridge in the Parliaments of 1621, 1624, and 1625. In 1618-23 Naunton was Secretary of State through the influence of the Duke of Buckingham, and thereafter until shortly before his death was master of the court of awards. His *Fragmenta Regalia*, which gives an account of Queen Elizabeth's courtiers, was left by him in manuscript. First published in 1641, a new edition, edited by Edward Arber, appeared in 1870.

NAUPLIA, nā'plē-a. A town of Greece, the capital of the Nomarchy of Argolis, 7 miles southeast of Argos, on the Argolic Gulf (Map, Greece, D 6). It is the seat of an archbishopric and has railroad connection with Corinth. The impregnable situation of its harbor, protected by strong fortresses, renders it of great strategic importance. The principal sights consist of the Museum, the Acronauplia or ancient acropolis, and the Palamidi, a fortification originally constructed by the Turks and later strengthened by the Venetians, which is at present utilized as a prison. Owing to its advantageous situation and spacious harbor, Nauplia is of some prominence commercially. It has ordnance factories and naval yards. From 1829 to 1834 it was the capital of Greece. In mediæval times Nauplia was one of the leading cities of the Peloponnesus. Here in 1831 Capo d'Istria, the President of the Republic, was assassinated. Pop. (commune), 1907, 12,176.

NAUPLIUS (Lat., sort of shellfish, which sailed in its shell as in a ship, from Gk. *naūs*, *naus*, ship + *πλεῖν*, *plein*, to sail). A larval stage in the development of certain crustaceans. See METAMORPHOSIS, and PLATE of BARNACLES.

NAU'SEA (Lat., from Gk. *ναῦστος*, *nausia*, seasickness, disgust, nausea, from *naūs*, *naus*, ship). A distressing sensation always referred to the stomach. It is unattended by pain, but is usually accompanied by a feeling of general languor or weakness, a small and often irregular pulse, a pale, cool, and moist skin, general muscular relaxation, an increased flow of saliva, and a sensation that vomiting will supervene. It is most commonly a *direct* symptom of disease or disorder of the stomach, but sometimes it is a very important *indirect* symptom of disease of some part at a distance from the stomach—as, e.g., the brain or the kidney. The nausea of pregnant women is due to reflex irritation excited by the enlarged uterus.

Among the more common causes of nausea (which may or may not be followed by vomiting) may be mentioned fainting spells, the taking of a general anæsthetic, and disturbances of equilibrium affecting the eyes or internal ear, e.g., car sickness and seasickness. It may be provoked by blows upon the head, abdomen, testicles, or ovaries, or by powerful mental impressions such as revolting sights, odors, or sounds, and sudden fright. Other causes are discussed under VOMITING.

NAUSHON, nā'shōn'. One of the Elizabeth Islands (q.v.).

NAUSICAA, nō-sīk'ā-a (Lat., from Gk. *Ναυσικάα*, *Nausikaa*). In the *Odyssey*, vi-viii, the daughter of the Phæacian King Alcinous. When Odysseus is wrecked on the coast of Scheria, her father's island, she discovers him and conducts him to her father's court.

NAUTCH, nāch (Hindi *nāch*, Prak. *nachcha*, from Skt. *nāṭya*, dance, *nṛitya*, dancing, acting, from *naṭi*, *nṛit*-, to dance). The term applied, especially in northern India, to the dancing girls attached to the temples. The corresponding word in the south of India is *bayadere* (q.v.). The presence of these girls at temples and their double rôle of attendants on the deity and of courtesans is undoubtedly a survival of the custom formerly widespread, especially in the East, of sacred prostitution. The daughters of nautch girls are generally trained as successors of their mothers. As in like religious customs elsewhere, no social odium attaches to these women. The nautch dancers are completely enveloped in winding drapery, and move with slow and rhythmic motions of the body, while the hands are busied in graceful gesturing or management of drapery. The feet are little used. The nautch dance is primarily erotic in character, and now is often regarded by the natives as symbolizing the loves of Krishna (q.v.) and the milkmaids. See BAYADERE.

NAUTICAL ALMANAC (from Lat. *nauticus*, from Gk. *ναυτικός*, *nautikos*, pertaining to ships or sailors, from *ναύτης*, *nautēs*, sailor, from *naūs*, *naus*, Skt. *nāu*, ship). A volume issued annually and containing primarily the astronomical data required by navigators in the computation or reduction of the sextant observations by which the ship's position at sea is ascertained. The preparation and publication of these almanacs is very costly, and is therefore undertaken as a work of public utility by several different governments. Thus, the United States issues the *American Ephemeris and Nautical Almanac*. Germany, the *Berliner astronomisches Jahrbuch*. France, the *Connaissance des temps*; and Great Britain, the *Nautical Almanac*. To the astronomer the *Nautical Almanac* furnishes a great mass of important data: it gives the position of the moon in right ascension and declination for every hour and the sun's latitude and longitude for every day in the year; it shows the obliquity of the ecliptic, the sun's and moon's parallax, aberration, etc., at different times; it supplies the necessary data for the determination of the real or apparent size, position, and motion of the planets and their satellites, it fixes accurately the places of the more important stars; and gives full details concerning eclipses, occultations, transits, and other celestial phenomena occurring during the year. It is generally issued two or three years in advance of its date for the sake of mariners going on long voyages. See ALMANAC.

NAUTICAL SCHOOLS. See NAVAL SCHOOLS OF INSTRUCTION.

NAUTICAL SURVEYING. See HYDROGRAPHY.

NAUTICUS, na'ti-kūs. See CLOWES, W. L.

NAU'TILOI'DEA (Neo-Lat., from Lat. *nautilus*, from Gk. *ναύτιλος*, sailor, *nautilus*, from *ναῦς*, *naus*, ship + *είδος*, *eidōs*, form). An order of fossil Cephalopoda, equal in rank to the Ammonoidea, containing about 2500 species that range from Cambrian to recent time, and are represented at present by only two or three living species of the genus *Nautilus*. The most ancient forms were straight conic shells (*Orthoceras*), which soon became coiled like the modern forms. Many of the extinct genera and species are most important horizon markers or index fossils. See CEPHALOPODA; NAUTILUS; ORTHOCERAS.

NAU'TILUS (Lat., from Gk. *ναύτιλος*, *nautilus*, sailor, from *ναῦς*, *naus*, ship). The pearly nautilus (genus *Nautilus*) is the only living representative of an immense assemblage of shelled cephalopods of the subclass Tetrabranchiata, which flourished during past geological

pletely closed tube as in the squids, but a locomotive organ, through which, as in other cephalopods, the water is ejected with sufficient force to throw the animal backward. In swimming forward, says Kent, the tentacles are extended radially from the head.

The mouth is in the centre of the lobes and groups of tentacles, armed with a tongue (radula) and a pair of remarkably powerful horny jaws tipped with carbonate of lime. Olfactory organs and osphradia are present. The animal is attached within the living chamber by two oval muscles. The compartments of the shell are usually said to be filled with air or gas, but according to Verrill they are filled with sea water, which may be taken in or expelled so as to equalize pressure at varying depths.

Until recently the living nautilus was exceedingly rare, though the empty shells are cast ashore in great quantities in the Pacific and Indian oceans. Yet they have been for a long time trapped in baskets like lobster traps by the natives of some of the Melanesian and Fiji islands and used as food. Willey at Ralum, in New Britain, succeeded in trapping the nautilus in 70 fathoms of water. He also succeeded at Lifu, one of the Loyalty Islands, in capturing specimens at a depth of only three fathoms. These he kept in a large submerged cage, feeding them daily until his efforts were rewarded early in December, 1894, by finding that they had spawned in the cage, yielding an abundance of eggs. These are not laid in bunches, as is the case with those of the squid, but are deposited separately by the female. Each egg is as large as a grape. There are said to be three species now living in the Pacific Ocean, while the number has been carried up to even four. The two better-known species are *Nautilus pompilius* and *Nautilus umbilicatus*.

Fossil Nautili. Although the family Nautilidae dates from the Jurassic period, the genus *Nautilus* is doubtfully referred to the Tertiary. The order Nautiloidea, however, originated as early as the Ordovician; the earlier types were straight and uncoiled, like *Orthoceras*. Very striking, says Hyatt, is the marvelously sudden rise of the Nautiloidea as a group; it reached its maximum in the Silurian, followed by a decline extending from the Devonian to the Triassic period. Then the forces acting unfavorably upon its existence were arrested, or their violence lessened, and the group has been affected by only very slight changes and an exceedingly slow process of retrogression until the present time.

Bibliography. NAUTILUS, PAPER. See ARGONAUT.

NAUVOO, na-voo'. A city in Hancock Co., Ill., 12 miles north of Keokuk, Iowa, on the Mississippi River (Map: Illinois, B 4). It is in a highly productive fruit-growing country, where

PEARLY NAUTILUS (*Nautilus pompilius*).

Seen in section showing the chambers and siphuncle. (Half natural size.)

ages. The shell is coiled in one plane, divided into chambers by partitions or septa, the outermost being called the living chamber, as it contains the animal; the septa are perforated by the siphuncle, which is central or nearly so, and the aperture is wide and spacious. The shell consists of two layers, the outer being porcellaneous, the inner pearly, or nacreous, whence the name "pearly" nautilus. The initial chamber consists of an obtuse incurved cone, marked on the outer surface of its posterior wall by a small scar called the cicatrix. It is supposed that a perishable embryonic shell (protoconch) was formed, the presence of which is indicated by the cicatrix.

The body is short and thick, divided into a large obtusely conical head bearing eyes, tentacles, ears (otocysts), and a rounded sacklike trunk. The mouth is surrounded by about 90 external filiform tentacles. The pair of tentacles on the inner or dorsal side are fused so as to form a hoodlike lobe by which the aperture of the shell is closed when the animal is withdrawn into the living chamber. Beneath is the funnel (hyponome), not forming a com-

the leading industries are wine making and the culture and shipment of fruit for market, particularly grapes and berries. St. Mary Academy and Spalding Institute, conducted by the Benedictine Sisters, are in Nauvoo. The most interesting features in this vicinity are the remains of the old Mormon buildings. The water works are owned by the city. Pop., 1900, 1321; 1910, 1020. Nauvoo was founded by the Mormons in 1839 and rapidly increased in size until in 1846 it had a population of 15,000. In this year the settlement was broken up by the people in the neighborhood. (See MORMONS.) An imposing temple, 128 feet long by 88 feet wide, left unfinished by the Mormons, was destroyed partly by fire in 1848 and partly by a tornado in 1850. In the latter year a company of French communists, called Icarians (q.v.), under the leadership of E. Cabet, occupied Nauvoo, but their experiment proved a failure, and they abandoned it in 1858.

NAVA, ná'vá. A seaport of Japan. See NAWA.

NAVAHO, or **NAVAJO**, nāv'a-hō. An important tribe of Athapascan stock (q.v.). Their present reservation in northeastern Arizona and extending into New Mexico and Utah comprises nearly 10,000,000 acres, but it is almost entirely an arid desert of sand and rock, unfit for any purpose except scanty grazing. Like other tribes of the same stock, they call themselves simply *Diné* (people); they are called *Apaches de Navajo* in Spanish records at least as early as 1630. They came originally from the far northern home of their kindred, but have incorporated elements from all the neighboring tribes. They were roving and predatory in their habits and were continually at war with the Ute and the Plains tribes. They were alternately at war or peace with the Spaniards during the early colonization period, but later became so troublesome that in 1705 and again in 1713 it was necessary to bring them to terms by vigorous invasions of their country. In 1744 Franciscan missionaries attempted to civilize them, but in a few years the effort was abandoned. In 1805, in consequence of continued raids, a Spanish force penetrated their stronghold in Tseyi (Chelly) Cañon and inflicted a severe defeat, killing 115 men, women, and children. The lesson, however, was soon forgotten, and between the fall of the Spanish power about 1815 and the American occupation of the country 30 years later they made the stealing of sheep, cattle, and horses from the Mexican settlements a steady and profitable business. With their booty they were enabled to become a pastoral tribe, and they adopted from the more civilized Pueblos a well-developed weaving art. From the Mexicans they learned the simpler forms of metal working, especially in silver. In 1846 a number of prominent chiefs made their first treaty with the American government, but, on account of the unfortunate killing of the principal signer three years later, the tribe again became hostile. Hostilities continued with but short intermissions until 1863, when it was determined to deport the entire tribe to the Bosque Redondo reservation on the Pecos River, near Fort Sumner, in eastern New Mexico. In the ensuing winter a mixed force of whites and Ute Indians under Kit Carson invaded the Navaho country and forced their cañon stronghold. Within a year nearly 8500 had been deported to the Bosque Redondo, and

it was supposed that not more than 2000 remained at large in their own country, but later developments proved that not more than half, and these not the most troublesome, had been removed. The experiment proved a failure. The stock of the Navaho died or was stolen, their crops failed, and their numbers decreased from disease, escapes, and attacks by the Plains tribes. In June, 1868, a new treaty was made, under which the captives, then numbering 7300, were returned to a reservation set aside in their old country, and were given sheep and cattle with which to begin life anew. Since then they have remained quiet, steadily increasing in wealth and population. In 1884 the reservation was extended to its present dimensions to accommodate their rapidly increasing herds.

The Navaho have a fully developed clan system, including some 50 clans, with descent in the female line. Their government is democratic and local rather than centralized, since the nature of their country and occupation prevents the formation of large organized bodies, so that each family shifts for itself in the search for temporary pasturage and water supply. They are agricultural to a limited extent. They make some pottery and baskets, but derive their main subsistence from their herds of sheep and goats, together with horses and some cattle. They are well known for the beautiful and durable blankets which they weave from the wool of their flocks and for their artistic silver ornaments. (See colored plate of INDIAN BLANKETS with the article BLANKET.) Although they are nomadic, they build at each regular halting place permanent *hogáns*, or circular houses, of logs covered with earth, with a short covered entrance way and smoke hole at the top. Men and women alike are almost constantly at work caring for their herds, weaving, or laboring at the forge. They have elaborate and spectacular ritual ceremonies and an abundant mythology, with hundreds of sacred songs in the keeping of their priests. Aside from the industries which they have made their own they have adopted but little of the white man's civilization or teaching. They are estimated now at 22,455, less than half of whom are within the reservation limits, the rest ranging on outside pastures or working in the white settlements. NAVAHO BLANKETS. See BLANKET, with Colored Plate.

NAVAL ACADEMY, UNITED STATES. The school at which are educated the executive officers of the United States navy. It was founded as the Naval School in 1845, at Annapolis, Md., with a course fixed at five years, the first and last of which were to be spent at the school; but this plan was not strictly adhered to even at first and was subsequently changed. In 1849 the course was changed to seven years, the first two and last two being spent at the school and the three intervening years at sea, and the name of the institution

was changed to United States Naval Academy. In 1851 the four years of study were made consecutive, and annual practice cruises were commenced. In 1861 the academy was removed to Newport, R. I., on account of the war. It returned to Annapolis in 1865.

In 1873 the course for cadet midshipmen was extended to six years, the last two to be spent at sea. In 1882 the title of cadet midshipman was changed to naval cadet, which in 1902 was replaced by that of midshipman. Appointments to the different corps were made by the Secretary of the Navy upon recommendation of the academic board, but only enough appointments were made to fill vacancies, all other graduates being honorably discharged. In 1889 the law provided that the cadets of the first class (seniors) should be separated at the beginning of the year into two divisions, and those destined for the line and the engineer corps should pursue separate courses of study during the first-class year. In 1889, also, the age of candidates at date of admission, which had been from 14 to 18 years, was changed to 15 to 20 years. In 1899 the Act of March 3 consolidating the engineer corps with the line abolished the separate line and engineer divisions at the academy. The same Act increased slightly the numbers in all grades of the service and very much increased the lower grades. The supply of graduates thus became insufficient, and in 1900 the number of cadets at the academy was increased by an Act authorizing appointments to the academy every four years instead of every six. The number of officers in service subsequent to the Spanish-American War was wholly inadequate to the increasing demands of the fleet, and, as the only means of adding to the number is through the Naval Academy, an increase in the number of midshipmen was proposed. This increase, made by Congress in 1902, provided for the appointment of a midshipman every two years by each Senator, Congressman, and Delegate in Congress, and 11 by the President. By the Act of March 7, 1912, the probationary period of two years at sea was eliminated and the course fixed at four years, at the end of which, upon graduation, the midshipmen are commissioned as ensigns.

The course of study and instruction at the institution is much more advanced than the term "academy" would imply, is beyond that of most colleges, and approximates that of many postgraduate technical schools. The course for the first year (fourth class) includes mechanical drawing, algebra, geometry, descriptive geometry, trigonometry, English studies, French, Spanish, and hygiene, and practical exercises and instruction in seamanship, boats, ordnance, target practice, infantry, artillery, battery drill, fencing, gymnastics, dancing, and swimming. The course for the second year (third class) includes trigonometry, conic sections, differential and integral calculus, mechanical drawing, physics, chemistry, naval history, French and Spanish, and practical exercises and instruction in seamanship, boats, signals, ordnance, target practice, infantry, artillery, battery drill, fencing, and steam engineering. The course for the third year (second class) includes seamanship, principles of mechanism, mechanical processes, mechanical drawing, marine engines and boilers, integral calculus and mechanics, physics, chemistry, and electricity, and practical exer-

cises and instruction in seamanship, boats, steam tactics, signals, ordnance, infantry, artillery, battery drill, target practice, fencing, and steam engineering. The course for the fourth year (first class) includes seamanship and naval tactics, gun and torpedo drills, naval ordnance and gunnery, ballistics, theoretical gun construction, navigation, theory of compass deviations, marine surveying, boilers, naval construction, engineering materials and designing, physics, electricity, and Spanish, and practical exercises and instruction in seamanship, boats, steam tactics, battery drill, target practice, torpedo practice, ordnance, artillery, infantry, fencing, compass correction, navigation, surveying, steam engineering, practical electricity, turret drill, international law, etc.

From about the first of June until the first of September the midshipmen are embarked on war vessels for the summer cruise, when they are instructed practically in the various duties of their profession. For several years since the Spanish-American War the practice vessels have been comparatively modern war vessels temporarily detached from the reserve fleet. Until 1898 most of the buildings of the academy were very old, many of them dating from the early part of the nineteenth century, and the accommodations for the midshipmen inadequate as well as unsuitable. The necessary expansion of the institution was brought to the attention of Congress by the war, and a very liberal plan of rebuilding the academy was adopted. The expenditure authorized was \$10,000,000. The work is now completed, and the result is the best-equipped and handsomest naval institution of learning in the world. The headquarters of the postgraduate schools (see NAVAL SCHOOLS OF INSTRUCTION) is at the Naval Academy, though many of the courses are taken elsewhere. Consult. J. R. Soley, *History of the Naval Academy* (Washington, 1876), Park Benjamin, *The United States Naval Academy* (New York, 1900), United States Navy Department, *Courts Martial at the Naval Academy* (Washington, 1906), J. M. Conover, "West Point and Annapolis in Civil Service," in the *Nation*, vol. xcvi (New York, 1914).

NAVAL AÉRONAUTICS. The various problems connected with the military use of the dirigible balloon and the aéroplane at sea are much the same as on land. In respect of construction, the dirigible is the same for both services; the aéroplane, however, must be so designed that it may alight on or rise from the water; hence the hydroaéroplane. As in the land, so in the sea service—one has to consider both offensive and reconnoitring applications of the two classes of machines.

If the offensive employment of the dirigible ashore is attended with uncertainty, still greater uncertainty waits on its use against ships. Apart from the probability of missing, increased at sea, by the condition that the target, the ship itself, is in motion, it may be remarked that light projectiles would be practically harmless against turrets and armored decks, and that the number of really destructive projectiles that may be carried is limited. At any useful height a dirigible would be seriously exposed to ship fire, delivered by guns especially designed for this sort of fire. Under this head, as under so many others of military aëronautics, experience is lacking, or, if not experience, then information in respect of achievement. If a conclusion from

negative evidence be permissible, we may take it for granted that the dirigible, in the offensive against ships, has proved a failure. It has been suggested that dirigibles could be effectively used to detect and even to attack submarines and submarine mines and mine fields, for, if the water be clear, these would all be visible from above. An instance was furnished in the War in Europe by the action of the German submarine U-9, which it was said was informed and guided by a Schütte-Lanz airship; on the other hand, this feat could as well have been performed by an aeroplane.

In reconnaissance dirigibles could be sent out to report on the presence of a hostile fleet, upon its course if under way, and upon the nature and number of its units. Indeed, this sort of work could be more readily performed at sea than the corresponding work ashore: the dirigible becomes assimilable to a lofty observation station in communication with its own fleet or base, and enjoying, when the weather is good, an uninterrupted view in all directions.

If the weather be unfavorable, so as to obstruct the view, scouting could still pick up the hostile fleet, for it must be recollected that a naval enemy is completely revealed as soon as clearly seen, and is much more readily detected than a land enemy. In general, it is asserted that a dirigible accompanied by a mother ship carrying supplies, and equipped to generate hydrogen gas, would be of inestimable value to an admiral.

Recent as is the application of the aeroplane to the land service, still more recent is that of the hydroaeroplane to sea service. This machine has the same functions in respect of naval operations and of coast defense as the ordinary aeroplane of land operations. In a military sense, the problems that arise in its use do not differ in principle from those of the land machine, the special objective is different. Obviously, should the necessity arise, a land machine could be used in naval war, and a water machine in land war, but since a land machine cannot alight on or rise from the surface of the water, the seaplane is both logical and necessary. Accordingly we find great naval powers developing this branch of military aeronautics, other things equal, in the same ratio as that of the land service, with England, France, and Germany leading.

On the whole the reconnaissance problems that present themselves to the hydroaeroplane for solution are somewhat simpler than the corresponding ones in the land service. For example, if an invading fleet purpose an attack upon coast works, the position and nature of these can be accurately determined. If, on the other hand, the coast defense sends out the hydros to reconnoitre an attacking fleet, an accurate report can be made of the number and nature of the elements comprising the fleet. This, of course, is equally true of the reconnaissance made by two fleets operating against each other. In the two latter cases two or three hydroaeroplanes can more quickly, more accurately, and more economically perform the duty involved than a far greater number of destroyers or rapid cruisers. This is a most important consideration. A Cervera to-day would find it impossible to conceal his fleet for over 24 hours.

In purely naval work the chief duty of the

hydroaeroplane is that of reconnaissance. The French naval manœuvres of 1913 in the Mediterranean established beyond all possibility of doubt the importance of this sort of craft on this duty to a naval commander.

The service is organized by the establishment of shore stations, naval centres ashore; but just as aeroplanes accompany an army in the field, so must hydroaeroplanes a fleet at sea. We may accordingly expect that warships will carry them in the future. As a matter of fact, in 1914 the U.S.S. *Mississippi* did take five hydros and flying boats to Mexico, and these were used in the American occupation of Vera Cruz. In Germany hydroaeroplanes are so constructed that they can be picked up by a crane and hoisted aboard, and then stowed until needed, when they are similarly put overboard.

On the English ship *Hibernia* a runway was constructed forward for the launching of the hydro, but this system, of course, was inconvenient unless, indeed, in future naval construction the deck shall be so designed as to be in itself a runway. This would seem to be a necessity in order to meet the case of a very rough sea, from the surface of which a seaplane could not possibly rise, although the existing military conditions might imperatively require the machine to take the air. Another method of launching a hydroaeroplane is by the catapult devised by Capt W. I. Chambers, U.S.N. This consists essentially of a car running on a track and carrying the flying machine, the car is driven forward by the use of compressed air. It is claimed for this apparatus that it is small, may be mounted even on the top of a turret, indeed, may be used anywhere on the ship. When used, both the aeroplane and the car are projected from the track together. The car drops into the water after clearing the track, the aeroplane goes on its way in the air; the car is then hoisted aboard. To supply the needs of its air scouts a fleet may be accompanied by a mother ship or hangar ship, such as the *Foudre* of the French navy, but it will probably be found more economical and efficient to make the ship itself the unit, and so to regard hydroaeroplanes or flying boats as a part of its necessary equipment. The aeroplane will probably prove invaluable in commerce destroying both to the attack and to the defense. It is not inconceivable that commercial ships navigating waters liable to be invaded by hostile cruisers will themselves carry seaplanes, to give warning of the enemy, and so to enable the vessel to shift her course and avoid capture.

On the employment of the hydroaeroplane as an engine of destruction it is not necessary to dwell, the same limitations exist in its case as in that of the aeroplane. But if certain authorities, chief among them Sir Percy Scott, R.N., may be believed, a great future awaits the hydroaeroplane in connection with submarines. That is, if some way can be devised to assure uninterrupted communication between them, the submarine will be regularly accompanied and guided by the seaplane. This would spell revolution in naval warfare and hence in naval types. In the meantime Admiral Fiske, U.S.N., has proposed to use the aeroplane in the torpedo attack of ships, the flying machines would in this case take the place of the submarine.

The aeronautical needs of the United States navy were fully set forth in a formal report submitted in 1914 by a board appointed to consider the matter. This board recommended an equipment of 50 aeroplanes complete; 50 outfits, spare parts, etc., for fleet service, and in addition 6 aeroplanes complete, 6 outfits, 4 knockdown trucks, and 6 hangar tents, as advanced base outfit. It further recommended the purchase of one dirigible for expeditionary service with the fleet, and of a special auxiliary ship for dirigible service in connection with the subject of a special auxiliary for aeroplanes. In its opinion Pensacola afforded the best site for the Naval Aeronautical Centre. This centre should have one commandant with two divisions, aeronautic and operative, each of sufficient personnel and various other officials. The aeronautical laboratory should be at the Washington Navy Yard. Further, the office of Naval Aeronautics should be created at the Navy Department, in the Personnel Division, under a director and an assistant director, with representatives from the various bureaus, navigation, ordnance, etc., and from the Marine Corps. The estimated first cost of the plan was \$1,297,700, surely a modest sum in comparison with the enormous expenditures of European nations. The Committee on Naval Affairs of the House recommended early in 1915 an appropriation of \$1,000,000 for an aerial corps, and special pay and allowances.

As in land operations pure and simple the aeroplane, so in coast defense the hydroaeroplane, can give notice of the nature, strength, and course of an approaching antagonist. The direct effect of this is to allow ample time in which to prepare ammunition, fire trial shots, and even to move troops from points not threatened to those that are. This case presents no difference of principle from the analogous case of one army approaching another. But in coast defense many conditions arise not found in ordinary operations. Other things equal, coast defenses have little to fear from fleets in broad daylight or, more generally, when the fleet and its course can be suitably observed. Hence a fleet commander may determine to run by in a fog or behind a smoke screen. To fire upon an enemy whose position is thus unknown would be an almost criminal waste of ammunition. In such a case the service of a hydro might be invaluable, by circling over the fleet and making a signal when passing over, e.g., the flagship. A series of such signals observed ashore might enable mortar and gun salvos to be fired. In the similar case of a run by night the hydro might be equally called upon to reveal the position of the fleet.

In direct relation with this possibility the hydroaeroplane of the future may be expected to offset the radical defect of the searchlight, viz., shortness of range, it may also compensate the deficiencies of the range-finding system in this same respect. To illustrate, the modern United States army L/15 12" mortar has, let us assume, a range of 20,000 yards, but the best searchlight will not illuminate beyond 8000; hence mortar fire, so justly dreaded by ships, at night practically ceases to exist for over one-half of its intended range of effect. Theoretically, at least, there is nothing to prevent the hydroaeroplane from taking up the work at 8000 yards and continuing it to the extreme range of the pieces interested. The hydro-

aeroplane will also be found useful in locating and possibly in attacking submarines and submarine mines, not merely in coast defense, but in naval operations generally; in reconnaissance against landing parties, and in correcting the howitzer and mortar fire directed against these parties.

In regard to the future it is believed by some authorities that if a seaworthy craft is to be had the seaplane must be both large and powerful. In other words, what is contemplated is a true flying boat, of great horse power, having sleeping accommodations, and carrying food and water. Hence the biplane is to be preferred to the monoplane. The seaplane must also be able to withstand a heavy sea. In a German test the machines were required to rise from and land on the sea, when the waves were breaking one meter high, crest to trough, and to float on such a sea for one hour, with the engines stopped, and without damage to any part from leakage. Specifications for the United States navy call for the construction of armored hydroaeroplanes to carry rapid-fire gun and ammunition and two passengers. These machines must have a maximum speed of at least 80 miles an hour, a radius of action at full speed of four hours, adequate climbing power, and be able to glide at an angle of 1 on 6. They must further be able to rise from the water and alight in the open sea under ordinary conditions, to ride at anchor or drift without danger of capsizing, and to fly safely in a 35-mile breeze. For bibliography and illustrations, see under AERONAUTICS and MILITARY AERONAUTICS, which can be read with advantage in this connection, but the fact should be emphasized that conditions have changed and are changing so rapidly that the latest information and developments, as well as conclusions derived from experience in the recent European War, can be obtained not from treatises but from the current files of such journals as *The Scientific American* (New York); the magazine *Flying* (New York); *The Journal of the United States Naval Institute* (Annapolis); *The United Service Magazine* (London); various European naval annuals and reports of the United States Navy Department.

NAVAL APPRENTICE. Naval apprentices in the service of the United States, such as are described under the head of APPRENTICE, are no longer enlisted. The title is now *apprentice seaman*, and the method of instruction is radically different. The applicant for enlistment must be 17 years old, of robust frame, intelligent, of perfectly sound and healthy constitution, free from all physical defects or malformations, and not subject to fits. He must also be able to read and write. The instruction at the training stations (Newport, Norfolk, San Francisco, and Lake Michigan) lasts about six months and includes the rudiments of training only. Apprentice seamen are taught the elements of naval discipline and how to take care of their person and their clothes. They are given instruction in rowing, knotting, and splicing, and in English studies; also a little knowledge of gunnery. When the course at the training station is completed, they are rated *ordinary seamen* and transferred to the regular ships of the service. Their instruction is there continued. See NAVAL SCHOOLS OF INSTRUCTION.

NAVAL ARCHITECTS AND MARINE ENGINEERS, THE SOCIETY OF. An association incorporated under the laws of New York State,

with headquarters in New York City. The object of the association is the promotion of the art of shipbuilding. It has a membership of about 900. The society holds annual meetings, and publishes *Proceedings*.

NAVAL ARCHITECTURE. See SHIP-BUILDING.

NAVAL CADET. See MIDSHIPMAN.

NAVAL CHEST. See CHEST, NAVAL.

NAVAL CLERK. See CLERK, PAYMASTER'S.

NAVAL COLLEGE, ROYAL. See ROYAL NAVAL COLLEGE.

NAVAL COLLEGE OF CANADA. A school for training naval cadets at Halifax. The course of study is three years, and the age at date of admission is from 14 to 16 years. At present the Department of the Naval Service does not in any way bind itself to issue commissions to graduates of the Royal Naval College nor, on the other hand, does it require cadets to adopt a naval career. Arrangements have, however, been made with the British Admiralty by which they have agreed to accept each year eight cadets who have completed their course at the college, provided these cadets have attained the required standard of efficiency. They will be entered in the Royal Navy as cadets of the same standing as graduates of the Dartmouth Naval College. Arrangements have also been completed with the McGill University and the University of Toronto, by which they will admit graduates of the college to the second year of the course of applied science in these universities. The entry is made through competitive examinations, the number of candidates selected being dependent upon the number of vacancies. Candidates must be British subjects and must have resided, or their parents must have resided, in Canada for two years immediately preceding the examination. A short period of absence abroad for the purposes of education may be considered as residence in Canada.

The entrance examinations take place in May at the examination centres of the Civil Service Commission. Blank application forms for admission and information concerning dates and plans of examination are furnished by the office of the Civil Service Commission, Ottawa. Candidates are examined in arithmetic, algebra, geometry, geography, history, writing and dictation, and either French or German: for the purpose of adding to their marks they may take two of four optional subjects—Latin, elementary science, drawing, or a second modern language. The fee for the examination is \$4. The candidate must be physically sound and will be examined to determine this. Cadets receive no pay while in the college. Each cadet is required to pay annually in advance a fee of \$100. In addition, he must pay a fee of \$350 for the first year and \$225 for each of the succeeding years. The college provides, free of expense, the necessary furniture, bedding, mess equipment, and table board. The training at the college extends over a period of three years, with vacations of six weeks at Christmas and six weeks in summer. The course of study at the college includes: mathematics, navigation, mechanics, physics, chemistry, engineering, seamanship, pilotage, French or German, English, geography, and history (including naval history).

NAVAL CONSTRUCTORS. Officers of the United States navy charged with the design,

building, and repair of ships. The corps of naval constructors is filled by appointment of graduates of the Naval Academy who are sent (after graduation) to the naval postgraduate school, or to special technical schools, for an additional course in shipbuilding and naval architecture. The general features of new types of ships are prescribed by the Secretary of the Navy upon recommendation of the General Board and Chief of Operations. The design and details are worked out by the chief constructor and his assistants in the Bureau of Construction and Repair of the Navy Department in consultation with the chiefs of bureaus of Steam Engineering and Ordnance. The building of the hulls of all naval vessels in private shipyards is supervised by naval constructors detailed to that duty, and they are in charge of hull construction and repair when the work is carried on in navy yards. In 1915 there were 5 naval constructors of the rank of captain, 5 of the rank of commander, 23 of the rank of lieutenant commander, and 18 of the rank of lieutenant; the assistant constructors are 24 in number, 14 with the rank of lieutenant and 10 with the rank of lieutenant, junior grade.

NAVAL CROWN. In heraldry, a rim of gold around which are placed alternately prows of galleys and square sails, conferred on one who performed some valiant act on the seas.

NAVAL ENGINEER. See ENGINEER, NAVAL.

NAVAL FUEL SHIP. See FUEL SHIP. NAVAL.

NAVAL GUNS. See GUNS, NAVAL.

NAVAL INSTITUTE, UNITED STATES. An organization founded at Annapolis in 1873 by the officers then on duty at the United States Naval Academy. It has for its object the promulgation of knowledge concerning naval affairs among the officers of the naval service. During the first years of its existence it issued occasional numbers of its *Proceedings*, but in a short time the publication was made quarterly, and this was continued until 1914, when it was changed to bimonthly. The publication is one of the largest and most important periodicals of its type in the world, and the character of its articles, which cover the whole range of naval affairs, is unsurpassed. Its bimonthly review of foreign naval activities is the most extensive and most conveniently arranged compilation given in any publication. Each year the institute offers a gold medal, a life membership, and a prize of \$200 for the best essay on any subject of interest to the naval service, reserving the right to withhold the offer if no worthy essay is presented. The institute also publishes a large number of books on naval, technical, and allied subjects.

All officers of the navy and persons holding positions under the Navy Department are eligible to membership, and other persons interested in naval affairs may be elected as associate or honorary members. The present membership of the institute includes about half of all the officers in the navy and is steadily increasing.

NAVAL LAW. See MILITARY LAW.

NAVAL LIEUTENANT. See LIEUTENANT.

NAVAL MACHINIST. See MACHINIST. NAVAL.

NAVAL MILITIA. See NAVAL RESERVE.

NAVAL OBSERVATORY, UNITED STATES. A government institution, situated at Washington, D. C., in lat. 38° 55' 14" N. and long 5h 5m 15.78s W., a division of the Bureau of Navi-

gation in the Navy Department. Its functions are to determine the positions of the sun, moon, planets, and stars for use in preparing the *American Ephemeris and Nautical Almanac*; to issue correct standard time by telegraph and radio at noon and at 10 P.M. daily, 75th meridian, for use of navigators and all others requiring accurate time, to test, purchase, distribute, and repair instruments of precision, including chronometers and gyrocompasses, used by the navy in navigation, surveying, and aeronautics, to conduct astronomical investigations of general and special scientific interest; and, since 1894, to publish the *American Ephemeris and Nautical Almanac*. It had its origin in a depot of charts and instruments established by the Navy Department under the charge of Lieut. L. M. Goldsborough, U.S.N., in 1830. In 1833 Lieutenant Wilkes, U.S.N., moved the depot to a site on Capitol Hill, and at his own expense built an observatory containing a transit instrument of 3¼-inch aperture, a Borda's circle, a 3½-foot achromatic portable telescope, a portable transit instrument, and a sidereal clock. In the summer of 1838 the Secretary of the Navy directed the superintendent "to make a constant series of observations in astronomy, magnetism, and meteorology, ordering an additional number of assistants (naval officers), and granting authority for the purchase of all necessary instruments." Under these instructions Lieut. J. M. Gilliss, U.S.N., began systematic observations in astronomy with additional instruments as follows: a sidereal clock and a mean-time clock; a meridian circle of 4½-inch aperture; a portable achromatic telescope of 3¼-inch aperture. The work done under his direction at the Capitol Hill depot between 1838 and 1842 was published in 1846 as *Astronomical Observations Made at the Naval Observatory*, being the first American volume of this nature.

A building for this depot was authorized by Congress in 1842 through the efforts of Lieutenant Gilliss, who, after consulting American and European scientists, prepared plans and erected the Naval Observatory. Soon after the instruments were in place Lieut. M. F. Maury, U.S.N., succeeded to the charge of the observatory, and in addition to astronomical work devoted much of his personal attention to the study of ocean currents and other hydrographic and nautical subjects. Among the earliest of the scientific achievements of the new observatory were the observations of Neptune secured in 1846 immediately after the discovery of that planet, which enabled Sears C. Walker, by identifying two older foreign observations, to determine the elements of the orbit of Neptune. The application by Prof. John Locke of electricity in recording observations resulted in the installation of the first practical chronograph at the observatory in 1849. With the 9.6-inch equatorial Assistant Astronomer James Ferguson discovered several asteroids between 1854 and 1860. The 26-inch lens made by Alvan Clark, at the time the largest refracting telescope in the world, enabled Prof. Asaph Hall to discover the satellites of Mars in 1877. The observatory was removed to Georgetown Heights in 1893, where the necessary buildings for offices, clockhouse, and vault, together with the houses for the following instruments, were erected: the 26-inch equatorial, the 12-inch equatorial, the 10-inch photo-equatorial, the 9-

inch transit circle, the 6-inch transit circle, the 5-inch prime vertical, the 5-inch alt-azimuth, the 5-inch transit, the 40-foot photoheliograph of 5-inch aperture, and numerous others. In addition to its routine work, the observatory has, since 1893, participated in such large works of international cooperation as the observation of a zone of stars for the *Katalog der astronomischen Gesellschaft*, the observation of the asteroid Eros and photographic reference stars for the determination of the solar parallax, the observation of an extensive catalogue of zodiacal stars, and the observation of the fundamental and intermediary stars for the Photographic Chart of the Heavens. There have also been made extensive series of observations of the satellites of the planets, of asteroids and of comets with determinations of their orbits, and a series of observations extending over 20 years for the determination of the constant of nutation. In the winter of 1913-14 separate parties from the observatory and from France, in cooperation, made independently the first direct determinations of the difference of longitude between Washington and Europe, by the interchange of radio signals from the naval radio station at Arlington and the Eiffel Tower radio station at Paris. The library contains about 28,000 volumes and is the most complete astronomical collection in the country. The publications of the observatory comprise more than 50 large quarto volumes, which contain full details of the work done, with many valuable scientific memoirs by Hall, Newcomb, and others.

NAVAL ORDER OF THE UNITED STATES. An hereditary patriotic society organized in Boston, Mass., on Nov 10, 1890, having for its objects the perpetuation of the deeds of the American navy through the encouragement of research in naval arts and science and the preservation of historic memorials relating to the navy of the United States. It includes a Grand Commandery and six State commanderies. There are two classes of companions. The first class includes veteran officers and their male descendants, and the second class, enlisted men who have received the United States naval medal for bravery in the face of the enemy. The badge of the order is a gold Maltese cross coated with blue enamel and edged with gold. In the centre of the obverse is the insignia of the navy of the United States with the motto "Fidelitas et Patria", on the reverse is the insignia of the Marine Corps. There are State commanderies in Massachusetts, Pennsylvania, New York, California, Illinois, and the District of Columbia. Representatives from these commanderies meet triennially as a general commandery. The total membership is about 500.

NAVAL RESERVE. In all the more important navies, in addition to the regular forces serving continuously with the fleet, there are certain others which are drilled and instructed in order to be able to supplement the *personnel* of the fleet in time of war. In peace these men are largely employed in the merchant marine, in yachts, in auxiliary government services, or are pensioners or have served the requisite length of time for pension or discharge, but are still within the limit of age. In some countries a portion of the naval reserves have not served either in the mercantile marine or the navy, but receive a certain amount of training for such service; while in countries in which

service in the army and navy is compulsory the greater part of the reserve is made up of men who have completed the requisite length of active service with the fleet.

The naval reserve of the United States was established by Act of Congress approved March 3, 1915. It consists of citizens of the United States who have served in the navy for four years or more or an enlistment during their minority. It is organized under the Bureau of Navigation of the Navy Department and is governed by the Articles for the Government of the Navy, and by the Navy Regulations and Instructions. Whenever actively employed with the navy its members, while so employed, are considered to be in all respects in the same status as enlisted men of the navy on active duty, except that they are not to be advanced in rating during times of peace. When not actively employed they are not entitled to pay or emoluments of any kind except the pay expressly provided for members of the naval reserve. Service in the naval reserve does not count for retirement.

Enlistments in the naval reserve are made for four years (unless sooner discharged), and must be made within eight years of final discharge from the navy. Enlistments are in two classes. Class one includes those enlisting in the reserve within four months of discharge from the navy. Class two includes all others. Men may also be transferred to the naval reserve at the expiration of enlistment in the rate in which serving, provided they have served 16 years in the navy. Members of class one and men transferred at expiration of enlistment are required to keep on hand such parts of their uniform as may be prescribed by the Secretary of the Navy, and all members of the naval reserve are issued a distinctive badge which may be worn with civilian dress. Members of class one who have served less than 8 years in the navy are paid at the rate of \$30 per annum; 8 to 12 years, \$60 per annum; 12 years or more, \$100 per annum. All members of class two receive \$12 per annum, and when first called into service receive a clothing allowance of \$30. Members of the naval reserve who are transferred to the reserve, after 16 years or more of active service, will be paid at the rate of one-third or of one-half their base pay, according to whether they have served 16 to 20 years or over 20 years, plus permanent additions thereto which they were receiving at the close of their last service in the navy. Members of the naval reserve may, in time of peace, be required to perform not less than one month's active service on board a vessel of the navy during each year of service in the naval reserve, and such active service shall not exceed two months in any one year. In time of war they may be required to serve throughout the war or their term of enlistment.

Members of class one and those who have been transferred to the reserve who reenlist in the navy within four months from the date of their discharge from the naval reserve will not receive gratuity pay for reenlistment, but their enlistment for purposes of determining pay will be held to have occurred within four months of discharge from the navy. The period of active service while in the reserve counts towards the time required to secure retirement for those who reenlist in the navy after service in the reserve.

Any enlisted man on the retired list may, in

time of war or threatened war, be called upon for such duty as he may be able to perform; while so serving he will receive the same pay and allowances as he had when retired. Enlisted men on the retired list are not eligible for enlistment in or transfer to the naval reserve.

Naval Militia. The naval militia of the United States is supplemental to the naval reserve. It is organized in the District of Columbia and in 22 States, viz., California, Connecticut, Florida, Illinois, Indiana, Louisiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Missouri, New Jersey, New York, North Carolina, Ohio, Oregon, Pennsylvania, Rhode Island, South Carolina, Washington, and Wisconsin. The total number of officers and men on Jan. 1, 1915, was 7785, divided as follows: commissioned officers, 589; warrant officers, 29; petty officers, 1573; men, 5594. Members of the naval militia receive no pay and are not required to serve on board ships in active service, but facilities for such service are granted every year. One or more vessels (mostly of small size) have been lent to the different States for the use of their naval militia for purposes of drill and exercise. Many of these are fully manned and equipped and take short cruises each year. All matters pertaining to the naval militia are under the cognizance of the Assistant Secretary of the Navy, who transacts all business concerning them with the various State authorities. A naval officer (usually a commander) has charge of naval-militia matters under the direction of the Assistant Secretary.

Reserve Ships. The ships in reserve are the older types of battleships, armored cruisers, cruisers, and many auxiliaries. The battleships and armored cruisers are commanded and manned by officers and men of the active navy, but only about one-third of the complement is kept on board. The cruisers are either out of commission or in use by the naval militia.

British Naval Reserve. The British naval reserve consists of (a) Royal Fleet Reserve, (b) Royal Naval Volunteer Reserve, (c) Pensioners (long-service men), (d) Royal Naval Reserve, (e) Coast Guard. The period of enlistment is 10 years, the first part of which is spent with the fleet and the last part in the fleet reserve. At the beginning of the War in 1914 the numbers in the reserve were:

(a) Royal Fleet Reserve.	
Immediate reserve	4,070
Class A — pensioners	8,327
Class B — nonpensioners	18,710
Class C — " (artificer ratings)	30
	31,137
(b) Royal Naval Volunteer Reserve (officers and men)	4,500
(c) Pensioners (long-service men)	8,110
(d) Royal Naval Reserve (officers and men)	20,348
	64,095
(e) Coast Guard (officers and men)	3,015
Total	67,110

The Royal Naval Reserve was created in 1860 and consists of officers and men employed in the merchant service but trained in the navy. For this purpose they are mustered annually on the drill ships in the different ports. They also serve (practically all the officers) on board the regular vessels of the navy, and when so serving are on the same footing as officers and men of the regular service. In times of peace they are largely called out in the annual manœuvres.

German Naval Reserve. Service in the German navy is compulsory upon the seafaring and emicseafaring population and lasts in theory for seven years. Three years of this are spent in active service with the fleet and four years in the fleet reserve when the annual manœuvres or requirements of the fleet do not call for their services. Each reservist is required to take part in two training courses, not to exceed eight weeks each, during the four years. He then passes into the *Seewehr*—in its first class for five years and then into its second class, where he remains until he reaches the age of 39 years. There is also an *Ersatz Reserve*, which serves, in mobilization, for completing the complements of the navy. It is composed of men who have not served in the navy because they were in excess of the number required, or were exempted for domestic reasons, or did not fully satisfy the physical requirements. They are subject to call to attend the training courses before their thirty-second year, but these courses have not been held for a long time, as their services were not needed. At the beginning of the European War which broke out in 1914, the effective reserve consisted of about 90,000 men.

The French, Russian, Italian, and Austrian naval reserves are formed in a manner similar to that of Germany. At the beginning of the year of 1914 the French reserve consisted of about 60,000 effectives, that of Italy of about 10,000, and that of Austria of 15,000. Russian naval reserve probably exists only on paper. It is never been adequate, even to man the fleet for manœuvres. See NAVIES.

NAVAL SCHOOLS OF INSTRUCTION.

The United States naval schools for officers consist of the Naval Academy (q.v.), the Naval War College, and postgraduate schools in ordnance, marine engineering, electrical engineering, aviation, medicine, and the marine school of application. The Naval War College was established at Newport, R. I., in 1881. It performs the double function of instruction and of preparing plans of operations in conjunction with the General Board, the Office of Naval Intelligence, and the Chief of Operations. The president is a naval officer of high rank (captain or rear admiral), and there is a permanent staff of four to eight officers as assistants. Lectures are also given by distinguished authorities on international law, history, and other subjects connected with naval affairs. Officers are ordered for instruction in the long course (about 18 months) or the short course (three or four months). Others go there for the study of special professional subjects. The instruction consists in lectures on professional subjects, the study of naval war, and practical exercises in tactics and strategy on the war-game board. The postgraduate schools are for young officers who specialize in shipbuilding and naval architecture, ordnance, marine engineering, electrical engineering, and aviation. These are not schools in the sense of organizations, but more properly courses of study and instruction. The officers studying shipbuilding and naval architecture pursue their studies at the Boston Institute of Technology at present. They were formerly located abroad. The ordnance school consists in instruction at the gun factory, torpedo station, powder factory, proving ground, and at Washington University, covering all branches of ordnance and allied subjects. The marine engineering school consists in work at the en-

gineering experimental station and postgraduate school at Annapolis and in courses in marine engineering at various universities. The course in electrical engineering is taken at certain universities and includes radio (wireless) work. The aviation school has been divided between Annapolis and Pensacola. All officers pursuing postgraduate courses may be required to take part of their courses at the postgraduate school at Annapolis, Md. The naval medical school (see MEDICAL DEPARTMENT OF THE UNITED STATES NAVY) is at Washington. It gives young surgeons a course in naval medicine and hygiene. The marine school of application is at Annapolis, Md.

The schools for enlisted men are training schools, seaman gunners' school, electrical school, yeoman school, machinist mates' school, artificers' school, musicians' school, and the school for commissary stewards, cooks, and bakers. The training schools are at the training stations in Newport, Norfolk, North Chicago, and San Francisco (Yerba Buena Island). Recruits, upon first enlistment, are sent to those schools for six months' instruction before going aboard ship. (See NAVAL APPRENTICE.) The seaman gunners' school gives instruction (to men who have served one enlistment) in ordnance and machine work (Washington gun factory) and torpedoes (Newport torpedo station). The electrical schools are at the New York and Mare Island navy yards. Instruction is given in all kinds of electrical work, including radiotelegraphy. The machinists' mates' school, which trains men in all kinds of machine work and in the operation of boilers and machinery, is located at the Charlestown Navy Yard. The yeoman schools are at New York Navy Yard and at the Yerba Buena training station, and train men for naval clerical duties, including typewriting and stenography. The schools for artificers (carpenter, shipwright, plumber, copersmith, blacksmith, etc.) are at the Charlestown and Norfolk yards. The musicians' schools are at the Newport and Norfolk training stations. The schools for commissary stewards, cooks, and bakers are at the Newport and Yerba Buena training stations. At all training stations and on board all ships in commission the enlisted men are given instruction in English studies, mathematics, and the theoretical and practical parts of their work, the amount of instruction above a fixed minimum being based upon the man's aptitude and desire to acquire knowledge.

In several States there are public marine schools which are maintained by the States, but the training ships and officers are furnished by the Navy Department. These schools are for the education of young officers for the merchant marine.

Argentina. The naval school of Argentina is at Buenos Aires. The age at date of admission is 14 to 17 years, and the course is four years. This includes cruises on the training ship *Sarmiento*. The torpedo school is on the old cruiser *Maipú*. See NAVIES, *Argentina*.

Austria-Hungary. The greater part of the executive officers of the Austro-Hungarian navy are graduates of the naval academy at Fiume; the others are appointed provisionally, and serve in the fleet until able to pass a satisfactory examination. The age at date of admission to the academy is 14 to 16 years. The course is four years, three months of every year being

spent on board a practice ship. There are also a gunnery school, torpedo school, mining and telegraph school, and a training school for boys and recruits. These schools are either on board vessels or have vessels attached to them. The training school is on board an old line-of-battle ship and has sailing and steam practice ships as tenders.

Brazil. The executive officers of the Brazilian navy are drawn from the graduates of the naval academy on the island of Enxadas in the harbor of Rio de Janeiro. The limits of age at entrance are 13 and 17 years. The graduates are transferred to the naval college (also at Rio de Janeiro) for an additional course of four years.

Chile. The Chilean naval academy is at Valparaiso. The course is six years, previous to which the cadet must have completed three years at the military academy at Santiago. The course includes cruises on a training ship. The engineering school is at Talcahuano. Chile also has a naval war college, somewhat similar in character to that of the United States. It is reported that the course of instruction for Chilean officers is to be radically changed. Early in 1915 the Chilean government requested the detail of two officers of the United States navy, presumably to assist in this work.

China. Though China had practically no navy in 1915, the government was preparing for its enlargement by reopening its naval schools at Chifu, Nanking, Foochow, Canton, and Wusung. The most important of these is the one at Chifu, which has a director, 16 instructors, and 192 pupils. The budget for 1914 provided for the use of three vessels (1900 to 2200 tons) as school ships. See NAVIES, *China*.

Denmark. The Danish naval school for executive officers is at Copenhagen. There are 10 admissions each year, the candidates for which must be from 15 to 20 years of age and have served 9 months in the navy or 18 months in the merchant marine. After a preliminary cruise of three months they are reexamined; 6 of the 10 are selected and the others discharged. The course of instruction is four years. See NAVIES, *Denmark*.

France. The French naval school for the training of officers is at Brest. It was established by Napoleon in 1810 and comprised two sections—one at Brest, the other at Toulon. Both were on board vessels—the *Tourville* at Brest, the *Duquesne* at Toulon. After several changes the school was, in 1830, installed on a vessel anchored in the roadstead of Brest. Various ships have been assigned to this duty, but since 1841 they have borne or have been given the name of *Borda*. In 1911 the present buildings were commenced, and in 1914 the school was moved on shore to its new quarters. The requirements at entrance are high and approximate those of the Ecole Polytechnique. The age at entrance is from 14 to 18 years, and the course is two years. After completing the course at the naval school the cadets are promoted to the grade of *aspirant* (midshipman) second class, and sent on board a cruising training ship for one year for further instruction, especially in practical work. They are then promoted to *aspirants* first class, and their training ceases. The school for engineers is one of engine design and construction. Special courses are taken at the Ecole Polytechnique. The medical schools are three in number and are located at Brest, Rochefort, and Toulon.

The course of study is two years. There are also the superior training school for officers of the executive branch, and torpedo, gunnery navigation, and ordnance schools for the practical training of officers who incline to become specialists. Following the lead of the United States and British navies there is a certain unification of the instruction for executive and engineering officers and a tendency towards consolidation, as in the United States service. The school for apprentices of the enlisted force is on board three or more training ships. The schools for machinists, artificers, and stokers are also on board old vessels in the harbors of Toulon and Brest.

Germany. The German naval academy in 1913-14 was transferred to its new quarters at Murwik, near Flensburg. The enrollment of cadets takes place in April of each year. Candidates are ordinarily from 17 to 20 years of age. Those with "maturity" certificates from a royal high school (Realgymnasium) have certain advantages, and may receive commissions a year earlier than the men who pass less rigid examinations. After about five weeks' preliminary instruction cadets are sent on board practice ships (old cruiser of the *Hertha* class, 5600 tons) for the remainder of the year, during which the vessel cruises in home waters and abroad. At the end of the year they are examined and, if qualified are promoted to the grade of midshipman (*Fähnrich zur See*). The next year is spent in theoretical work in the professional sciences. After passing an examination concerning this work they spend six months in courses at the gunnery school, on the torpedo training ship and with the marine infantry, each course ending with an examination. They are then sent on board ships of the regular service for one year's practical training. At the end of this year those who obtain favorable certificates are promoted to the grade of ensign (*Leutnant zu See*), but remain another year on board, though their education is supposed to be complete when they are promoted. Candidates for naval engineers must be not over 21 years of age, of good character, have means sufficient to cover the service pay during four years (\$10 per month, decreasing to \$5 at the end), and have two years' practical experience at machine works. They enter with enlisted men's ratings but are kept separate from all others of their branch and wear a special uniform. On enrollment (in the autumn) they receive three months' training in military matters, then nine months' practical instruction on vessels of the high-sea fleet. After passing an examination they are promoted to petty officers. Then follow two years of practical experience in petty officers' duties on ships or torpedo vessels and one year's attendance at the engineers' school (one at Kiel, one at Wilhelmshaven). This is intended to provide the necessary theoretical groundwork for understanding what has been learned in practice. The rank of warrant officer is now obtained. Four years' experience in this rank is followed by a second school year, ending in promotion to the rank of commissioned engineer. Of the enlisted force of the German navy 73 per cent are derived from ship's boys. These are enlisted between the ages of 15 and 18 years. They serve two years as boys, three years in fulfillment of their service liability and four years in return for the training they

have received. They are enrolled in October, are instructed on a stationary training ship at Mürwik for six months, then have one year in a cruising training ship, and complete their instruction by six months on a stationary ship. They are then sworn in as seamen, being allotted, as far as possible, to the branch of the service they prefer—seaman, torpedo, mining, or submarine. The engine and fire room ratings are derived from the seafaring population possessing the required qualifications.

Great Britain. The British naval school for the instruction of officers is divided into two parts. One is at Osborne on the Isle of Wight and the other at Dartmouth. The age at entrance is from 13½ to 14½ years (though this has been frequently changed). The first two years of the course are given at Osborne, the last two years at Dartmouth. Then come eight months in a cruiser; after this, two years and four months' service as a midshipman, followed by promotion to sublieutenant. After promotion to lieutenant all officers must specialize as lieutenants of engineering, gunnery, torpedoes, navigation, instruction, or marines, or remain as general-service officers. Officers specializing in engineering go to Keyham for one year and to Greenwich naval college for six months. Nearly all who finish this course go to sea as engineers, but a few are selected for an advanced course of two years, and will eventually qualify as designing engineers. Junior engineers are given sufficient executive duty to render them familiar with it. Upon promotion all lieutenants become commanders in the general list of the executive branch, except engineer officers, navigating officers, and marine officers, who are commissioned in their own branch; but these revert to the general list on reaching the grade of captain, except the designing engineers and the greater part of the marine officers. The naval college at Greenwich is a postgraduate school in all the naval sciences and branches. The course varies, but the full term is usually two years. The naval war college (very similar in character to that of the United States) is located at Portsmouth, but it was reported that it would be moved to Greenwich. There were several aviation schools in 1915, owing to war conditions. There are also torpedo schools and gunnery schools located on board ship. The headquarters of the gunnery school is on the gunboat *Excellent* at Portsmouth. The torpedo schools are at Portsmouth and Devonport. These schools also instruct enlisted men. The other schools for the enlisted force include training ships for boys, for boy artificers, and for mechanics; also a cooking-school ship. The drill ships for the Royal Naval Reserve and for the Royal Naval Volunteer Reserve are large vessels of old type located at ports convenient for the purpose. Canada and Australia have established naval forces and naval academies and training schools. The Canadian academy (see NAVAL COLLEGE OF CANADA) is at Halifax, and the Australian is at Sydney.

Italy. The Italian naval academy is located at Leghorn (Livorno). The instruction is in two parts: (a) the normal course and (b) the superior course. These courses have recently been considerably changed and the age of admission lowered. It is now 12 to 15 years. The normal course is five years in length, eight months of each year being spent at the academy and three months on practice ships. At the

end of the course all cadets who pass the required examinations are appointed midshipmen and sent to sea for at least a year. They are then commissioned as sublieutenants and sent to the academy for the superior course, which comprises two sessions. The first is obligatory for all sublieutenants; the examination at the end of it fixes the rank of the officers in their grade and affects greatly the question of their advancement (one-third are promoted by selection and two-thirds by seniority). To the second session are admitted only those who have attained a certain standard in their examinations, and these more fortunate young men receive a diploma which has an important influence upon their naval career and eventual promotion. The naval constructors, constructing engineers, and commissary officers are also graduates of the academy. The schools for the enlisted men are five in number. There are also training ships for seamen. The question of training officers and men has recently been extensively considered, and it was proposed to follow the British system more closely, particularly in regard to the education and status of engineer officers.

Netherlands. The naval school for the Netherlands navy is located at Willemsoord. The age of entrance is 14 to 17 years, and the course is four years. At the end of the course the cadets who pass the required examinations are appointed as cadets of the first class. After two years in ships of the regular service they are again examined and, if found qualified, are commissioned as second lieutenants. The special engineer school is at Hellevetsluis. There are also torpedo and gunnery school ships and training ships for instructing the enlisted force, also drill ships for the naval militia.

Norway. The Norwegian naval school furnishes not only the officers of the regular service, but also those of the reserve. Candidates for admission to the school must not be over 19 years of age and must have served for 21 months in the merchant marine. The course at the school is in two parts, inferior and superior. The inferior course is three years long, and at the end cadets become ensigns. Those ensigns who are not destined to form part of the regular navy are, after two years of ordinary service, made lieutenants of the reserve. The superior course has two terms of eight months each. After 18 months of additional service the graduates of the superior school are promoted to the rank of lieutenant. There are also gunnery and torpedo schools and training ships for the enlisted force.

Portugal. The naval school of Portugal is a polytechnic institution. The course for officers of the executive branch consists of three months on a training vessel, one year at the naval school, three months on a training vessel again, and lastly another year at the school. The graduates are then appointed midshipmen, and after two years of service are commissioned as ensigns. There are gunnery and torpedo schools for both officers and men and training-school ships for boys.

Rumania. Early in 1914 the Rumanian government decided to establish a naval academy at Kustendje. Eighteen officers, selected for instructors, were sent abroad for special study. See NAVIES, *Rumana*.

Russia. The training of officers in the Russian navy was being changed, and the details had not been fully settled at the time of the

Great War of 1914. The principal source of supply of officers was the Imperial naval academy at Petrograd (St. Petersburg). The course was four years, at the conclusion of which the cadets became midshipmen. The academy had postgraduate courses in strategy, tactics, international law, etc. In 1915 a new academy was under construction at Sebastopol at a cost, including equipment, of \$4,000,000. When it is completed the primary course of instruction will be transferred to the new institution, which will have quarters for 500 cadets. The old school will be retained as a naval college with postgraduate and advanced courses only, and will also house the naval war college. At Kronstadt there is a school of navigation and ordnance with a primary course of four years similar to that at Petrograd. Whether this institution is to be retained after the completion of the academy at Sebastopol was not stated, but it is presumed that it will be continued as a station for practical instruction in navigation, ordnance, torpedo, etc. There are also training schools (chiefly on shipboard) for engineers, machinists, gunners, torpedo men, seamen, etc.

Spain. The officers of the executive branch of the Spanish navy are graduates of the royal naval school. The age at entrance is from 13 to 18 years. The course is three years, at the end of which the cadets become midshipmen. They then serve one year on a ship detailed as the school of application, one year on the sailing vessel *Nautilus*, and one year on vessels in regular service. After passing an examination they are then commissioned as sublieutenants. There are also floating gunnery and torpedo schools and vessels for the training of seamen and boys.

Sweden. The Swedish naval academy for the training of officers of the executive branch is at Stockholm. The age at entrance is 13 to 16 years. The course is six years, eight months of each year at the academy and four months on a practice ship. Upon graduation the cadets are made sublieutenants. They are then sent for six months as instructors in a school (*Erercisskolan*) where the enlisted men receive their naval instruction. This is followed by six months' service of various kinds, including some time spent at the dockyard. They are then assigned terms of duty with the mobile defense of the coast and at the gunnery school, and after eight or nine months in cruising ships they are commissioned as ensigns. There are also a school of the mobile defense, a school for enlisted men (*Hærcisskolan*, already mentioned), a torpedo school, and a gunnery school.

Turkey. The Turkish naval school was broken up by the Great War of 1914. The course was supposed to last 10 years, but the instruction was very irregular.

Bibliography. The constant changes in the method and details of the instruction of officers and men have made all existing books obsolete, but much information of an historical character can be obtained from Soley, *Foreign Systems of Naval Education* (Washington, 1880); *Report of the United States Office of Naval Intelligence* (ib., 1888); Buchard, *Marines étrangers* (Paris, 1891). For recent changes, consult late numbers of *Naval Annual* (London), *Proceedings of the United States Naval Institute* (Annapolis, bimonthly); *Rivista Marittima* (Rome, monthly); *Journal of the Royal United Service Institution* (London, monthly), *Le*

Yacht (Paris, weekly), and various other naval periodicals. See **NAVAL ACADEMY**; **NAVAL COLLEGE OF CANADA**; section on *Navy* under each nation; **NAVIES**; **MIDSHIPMAN**; **NAVAL APPRENTICE** (recently renamed apprentice seaman).

NAVAL SIGNALS. See **SIGNALS**, **MARINE**

NAVAL STORES. The origin of this term, which commercially is applied to the great turpentine and rosin industry of the southern United States, is uncertain, but it is probably derived from the fact that these and other materials broadly included in this designation were at one time chiefly used by shipping. The list of articles so classed is ill defined. They are all of vegetable origin and include turpentine, rosin, tar, pitch, linseed oil, oakum, and certain varnishes and gums. Though still largely used on shipboard nearly all these substances now have a much wider application in manufacturing and the liberal arts. Many of them have medicinal value, such as tar, turpentine, linseed oil, and gum thus, or ordinary frankincense. The last named, commonly called scrape, is the crude gum which collects on the turpentine pine tree when an incision is made in its bark. It is used by druggists as an ingredient in certain ointments and other pharmaceutical preparations.

Wood Tar (see **TAR**) is still used for preserving hemp rope, which is impregnated with it. A mixture of tar and pitch or tar and rosin was used as a protective coating for the bottoms of wooden ships before the practice of coppering wooden vessels became practically universal.

Pitch is of various kinds, differing somewhat in composition, and is derived in several ways. The name is applied to a glue-like substance consisting of resinous hydrocarbons such as asphaltum, rosin, tar, etc. The pitch used in wooden ships was usually that derived from wood tar by the removal of the volatile products. It was also prepared by heating and mixing wood tar and rosin. It has to some extent been replaced by substances of a similar character called naval glue, seam cement, and other patented mixtures. It is used on board ship to fill the seams of wooden decks after they have been calked with oakum. For this purpose it is melted and poured into the seams. After it cools and hardens the surplus pitch is scraped off, leaving the seam level with the deck. The operation is called paying the seam. The seams in the sides and bottoms of wooden ships are similarly treated, though a sort of putty was and is used to a considerable extent, especially on the sides and decks of wooden yachts and on the decks of steel ones.

The other substances mentioned are described in separate articles under their own names—tar, rosin, etc. Many of the materials included under the head of naval stores have been replaced in part by petroleum and coal-tar products. While these substitutes are, as a rule, inferior to the articles they replace, they are cheaper and suffice for many purposes. The standards for naval stores as used by the United States government are prescribed by the Bureau of Chemistry of the Department of Agriculture and the United States Bureau of Standards. For a full discussion of the turpentine and rosin industry, including not only statistics but methods of production, see "Turpentine and Rosin," in *Thirteenth Census of the United States*, vol. x, *Manufactures*, 1910 (Washington, 1913); *Forest Products of the United States*, Appendix on "Naval Stores", also *Naval Stores*

Review (Savannah, Ga., current) and *Bulletins of United States Forestry Service*, especially Nos. 90, 116, and 119. See LINSEED; OAKUM; ROSIN; TAR; TURPENTINE, VARNISH.

NAVAL TACTICS. See TACTICS, NAVAL.

NAVAL TARGET PRACTICE. See TARGET PRACTICE, NAVAL.

NAVAL UNIFORMS. See UNIFORMS, MILITARY AND NAVAL.

NAVAL VETERANS, NATIONAL ASSOCIATION OF. A patriotic society organized in New York City in January, 1887, having for its chief purpose the preservation of the traditions and memories of the United States navy during the Civil War. It is also beneficial to its members. It admits to membership any officer or enlisted man who served in the United States navy, United States marine corps, or United States revenue marine service during any portion of the time between April 12, 1861, and Aug. 25, 1865, and who has been honorably discharged or has honorably resigned. The organization has a membership of about 7000, in 20 associations.

NAVAL WAR COLLEGE. See NAVAL SCHOOLS OF INSTRUCTION.

NAVARINO, ná'vá-ré'nó. A town of Greece, in the Morea and in the Nomarchy of Messenia, at the southern extremity of the Bay of Navarino (Map: Greece, C 7). It is officially called Pylos. The ancient Pylos was at the northern extremity of the bay, and is now called Palæokastro and Palæo-Navarino. Pop., 1909, about 2100, according to Baedeker. Along the front of the bay stretches the island of Sphagia, or Sphacteria (q.v.). In 1492 the Turks captured Navarino, and held it, with two or three short periods of interruption, till 1821, when it passed into the hands of the Greeks. In 1825 it was taken by Ibrahim Pasha, and on Oct. 20, 1827, in the Bay of Navarino, the allied British, French, and Russian fleets, numbering 24 ships and commanded by the British admiral Sir Edward Codrington, defeated the combined Turkish and Egyptian fleets, comprising 89 ships of war. In this battle 60 of the Ottoman ships were destroyed outright and the rest were driven ashore in a shattered condition. The Turks lost 6000 men, while less than 200 of the allies were killed. The battle of Navarino is one of the great battles of history, since it brought about the achievement of Greek independence. See GREECE, *History*, paragraph *The War for Independence*. Consult *Memoir of Sir Edward Codrington*, by his daughter (1873), and K. Baedeker, *Greece* (4th Eng. ed., Leipzig, 1909).

NAVARRAISE, ná'vá-ráz', L.A. An opera by Massenet (q.v.), first produced in London, June 20, 1894; in the United States, Dec. 11, 1895 (New York).

NAVARRÉ, ná'váir'. A former independent kingdom on both sides of the western Pyrenees, now constituting the Spanish Province of Navarra (capital Pamplona) and part of the French Department of Basses-Pyrénées. The Province of Navarra has an area of about 4055 square miles. A large portion consists of wooded mountains and well-watered valleys. The region about Pamplona is a treeless plateau. In the south, in the valley of the Ebro, is a fruitful district, called the Ribera (shore). In the southeast is a barren salt steppe. The

region is drained by the Ebro, its affluents, the Ega and Aragon, the Arga, an affluent of the Aragon, and the Bidassoa. The population of the province was 307,669 in 1900.

History. This territory was occupied in ancient times by the Vascones, the present stock of the Basques and Gascons, and they were never entirely subjugated by the Romans. The Visigoths met with sturdy resistance from the Basques, and had to content themselves with a nominal overlordship. The Basques were enabled to maintain some independence even during the Saracen conquest. Charles the Great, towards the close of the eighth century, conquered their country and made it a part of the Spanish mark. It soon became independent of the Franks, and for a time its history is very imperfectly known. Apparently Sancho Garcia (905-925), who wrested the region of the upper Ebro from the Saracens, was the first to bear the title of King of Navarre. In the form of government the Basque influence and the tribal feelings were strong and the governmental institutions were primitive. The King was elected, and was limited in his power by a council of 12 nobles. The Kingdom developed rapidly by conquests. Sancho III, the Great, who died in 1035, was also King of Castile, and Aragon was under his control as a dependency of Navarre. He divided his Kingdom among his three sons. Sancho IV of Navarre was murdered in 1076, and the nobles chose King Sancho of Aragon as their ruler. Until 1134 Navarre was united with Aragon (q.v.). After the death of Alfonso the Battler the people of Navarre chose the son of Sancho IV as King and recovered their independence. The country continued under this dynasty for 100 years, but Navarre, shut in by Castile and Aragon, was prevented from developing by conquests from the Moors. In 1234 Navarre passed by inheritance to Champagne. Queen Joanna of Navarre married Philip IV of France in 1284, and from that time until the extinction of the Capetian dynasty, in 1328, the history of Navarre was intimately connected with that country. Then the kingdom went, as a dowry, to Philip of Evreux, who married Joanna, daughter of Louis X. Her son was Charles the Bad (See CHARLES II of NAVARRÉ). His granddaughter Blanche married King John of Aragon, and Navarre was connected with Aragon from 1458 until 1479. John's daughter, Eleanor, who succeeded to the throne of Navarre in 1479, was married to Gaston de Foix, Viscount of Béarn, and thus Béarn was united with Navarre. Eleanor died soon after her accession and was succeeded by Francis Phœbus. His successor, Catharine de Foix, married in 1484 a French noble, Jean d'Albret. In 1512 Ferdinand of Aragon conquered what is now the Spanish portion of Navarre. The Kingdom was thus reduced to a small district to the north of the Pyrenees. Jeanne d'Albret married in 1548 Antoine de Bourbon. Their son, Henry, ascended the throne of Navarre in 1572, and in 1589 became King of France as Henry IV. Navarre was united to France by decree in 1607, but down through Charles X all French kings bore also the title of King of Navarre.

NAVARRÉ, MARGARET OF. See MARGARET OF NAVARRÉ

NAVARRÉTE, ná'va-rá'tá, DOMINGO FERNÁNDEZ (1610-89). A Spanish missionary. He was born at Peñafiel, Old Castile, entered the Dominican Order, and, after passing some time in Mexico, went (1647) to the Philippine Islands, where he became professor of theology at Manila. Later he made a missionary journey into the interior of China and resided there for a number of years, becoming in time the head of his order in China. During a persecution he was imprisoned at Canton, but escaped and reached home in 1673. In 1677 he became Archbishop of Santo Domingo. He published the first volume of his work, *Tratados históricos, políticos, éticos y religiosos de la monarquía de China* (1676), but the second volume was suppressed by the Inquisition. A projected third volume was never published. Consult *Churchill's Collection of Voyages and Travels*, vol. 1 (London, 1744).

NAVARRÉTE, FRANCISCO MANUEL DE (1768-1809). A Mexican poet, born at Zamora. He entered the Franciscan Order and ultimately became professor of Latin at the University of Valladolid. He attained some reputation, especially for his bucolic poetry. A collection of some of his works was printed as *Entretamientos poéticos del P. Navarrete* (Mexico, 1823, 2d ed., Paris, 1835).

NAVARRÉTE, JUAN FERNÁNDEZ DE (1526-79), surnamed El Mudo (the mute). A Spanish biblical painter, born at Logroño. He studied in different parts of Italy, especially (so says the usual account) at Venice under Titian, and returned to Spain after 20 years, with his reputation well established. In 1568 he was made painter to the King and was employed on the decorations for the Escorial. Among those still surviving are a "St. Jerome," "Christ at the Pillar," "The Nativity," "The Martyrdom of St. James," and a "Holy Family." In 1576 he painted his most famous picture, "Abraham and the Three Angels," for the Escorial, and in 1577-78 he further painted eight pictures representing the "Apostles," the "Evangelists," "St. Paul," and "St. Barnabas." Navarrete's manner and warm coloring show the influence of his master, Titian, and account for his second surname "the Spanish Titian." He plays an important part in the technical development of the Spanish school.

NAVARRÉTE, MARTÍN FERNÁNDEZ DE (1765-1844). A Spanish navigator and author, born at Avalos, Logroño, Spain. He entered the Spanish navy in 1780, served in the West Indies and in the Mediterranean, and took part in the combined French and Spanish attack on Gibraltar in 1782. He became a lieutenant in 1789, and was commissioned to collect documents relating to the history of the Spanish navy. From 1796 to 1808 he was detailed on special service in the Department of Marine, resigning in the latter year rather than recognize Joseph Bonaparte. He again took office after the restoration, became a recognized authority on naval affairs, and in 1823 was appointed director of the hydrographic office. At 27 he had been elected to the Royal Spanish

Academy of the Language; and he was a member of various other learned bodies, including the Royal Academy of History, of which he became permanent director in 1824. He was chosen Senator and made a Councilor of State, and in 1841 became a corresponding member of the Institut de France. His greatest work was his *Colección de los viajes y descubrimientos que hicieron por mar los españoles desde fines del siglo XV* (7 vols., 1825-65). He also wrote a *Life of Cervantes*, published with a new edition of *Don Quixote* (1820), and left material for two posthumous works, *Disertación sobre la historia de la náutica* (1846) and *Biblioteca marítima española* (1851). He helped establish the publication, by the Royal Academy of History, of the *Colección de documentos inéditos para la historia de España*, and saw the first four volumes through the press. The set now contains 112 volumes.

NAVARRO, ná-vü'ró, JOSÉ FRANCISCO DE (1823-1909). An engineer and financier, born in San Sebastian, Spain. He was prepared for the navy, but in 1841 came to the United States, where he received his English education in the Jesuit College at Baltimore. He visited South America and later settled in Cuba, where he took up the study of mechanics and railroading and became a member of a large mercantile firm. In 1855 he came to New York and there founded the first line of steamships between New York and Brazil (1863). He also became interested in a number of commercial projects, and in 1878 was one of the constructors of the Metropolitan Elevated Railway. He built one of the first large modern apartment houses in New York.

NAVARRO, MADAME DE. See ANDERSON, MARY ANTOINETTE.

NAVARRO, PEDRO (c.1460-c.1528). A Spanish general, who greatly developed the use of mines in war. In 1500 he was employed by Gonsalvo de Córdoba in the campaign against Naples. He was very successful in his use of mines against the famous Castello Nuovo in 1503, and was made Count of Alvetto, or Olivetto, by Ferdinand of Aragon. In 1508 he helped materially in the capture of Vélez de Gómera (the Peñón de la Gómera) by inventing a kind of floating battery, and in 1509 he did good service under Cardinal Cisneros in the conquest of Orán. After covering in masterly fashion the orderly retreat of the Spanish forces at Ravenna (1512), he was taken prisoner by the French. The King of Aragon refused to pay his ransom, and after languishing in prison nearly three years, Navarro was enabled to join the French army. He contributed largely to the success of the campaign of Marignano (1515). For a life of Navarro, consult Martín de los Heros, in *Colección de documentos inéditos para la historia de España*, vol. xxv (Madrid, 1854).

NAVAS DE TOLOSA, ná'vás dá tó-ló'sá. LAS. A village of Andalusia, Spain, 37 miles north of Jaén, the scene of a battle (July 16, 1212) between Alfonso VIII of Castile, aided by a large army of Crusaders, chiefly French and English, and an army of Almohades under Mohammed au Násir. The Christians were victorious and broke Mohammedan power in Spain.

NAVASOTA, náv'a-só'tá. A city in Grimes Co., Tex., 71 miles northwest of Houston, on the Brazos and Navasota rivers and on the Houston and Texas Central, the Gulf, Colorado,

and Santa Fe, and the International and Great Northern railroads (Map: Texas, E 4). Noteworthy features include the city-hall and high-school buildings and Washington Park. It has a cotton gin, compress, two cottonseed-oil mills, a cooperage, silo factory, and a creamery. A lock and dam on the Brazos River has been constructed here. Pop., 1890, 2997; 1900, 3857; 1910, 3284.

NAVASSA, nou-as'sá. A small island, measuring about $1\frac{1}{2}$ by $2\frac{1}{4}$ miles, in the West Indies, between Jamaica and Haiti, in lat. $18^{\circ} 25' N.$, long. $75^{\circ} 5' W.$ (Map: West Indies, D 3). It has no permanent population. The island is chiefly noted for the deposits of phosphate rock (presumably formed from bird guano) which cover the greater part of its surface and which have been exploited by an American company. Consult D'Inville, "Phosphate Deposits of the Island of Navassa," in *Bulletin of the Geological Society of America*, vol. 11, pp. 75-84 (1891).

NAVE (ML. *navis*, nave of a church, ship, Lat. *navis*, ship). *Primarily*, in church architecture, that portion of a church between the entrance and the choir or chancel, in cruciform churches, between the entrance and the crossing of the transepts. As most churches are oriented (see ORIENTATION), this means generally the long western arm of a cruciform church. *Secondarily*, the main central body of the church; particularly, in a church of several aisles, the central portion between the side aisles, usually much broader and loftier than the side aisles. (See AISLE.) Thus in the first sense the nave includes the side aisles, but extends only up to the crossing; in the second sense it denotes the broad and lofty central longitudinal division of the church, in the eastern as well as the western arm of the cross. These are difficulties to be overcome only by the use of explanatory phrases. The cathedrals of Carcassonne and Poitiers in France, of Erfurt and many "hall churches" in Germany, the cathedral of Perugia in Italy, and that of Vienna in Austria, have naves and aisles of approximately the same height, but the central division remains the widest and is still the nave. In the ordinary form of church the nave may be covered with a ceiling of wood or with vaulting; its elevation internally comprises usually three stories—the piers and pier arches or the columns, which separate it from the side aisles, the triforium (q.v.), and the clear-story (q.v.), whose windows admit light above the roofs of the side aisles.

The same use of the term for the middle and widest and highest division exists in the description of a Roman basilica, or bath establishment (thermae, see BATH), or any building which is lighted in part by windows in the wall of a higher division rising above the roofs of the lower divisions; thus, it is disputed whether the middle part of the Ulpian basilica at Rome was roofed and was a real nave, or open to the sky like a court.

A considerable number of English churches and a few in France have two equal aisles, divided by a single row of piers and arches and having each its own gabled roof, such churches are said to be double-naved.

NA'VEL. The umbilicus or navel is a round or oval depression in the median line of the abdominal wall, marking the site of attachment of the umbilical cord (q.v.), or funis, in the fetus. See OBSTETRICS.

NAVERO, EMILIANO GONZÁLEZ. See GONZÁLEZ NAVERO, EMILIANO.

NAVESINK (náv'e-sínk) **HIGHLANDS**. A chain of hills running nearly northeast and southwest and forming a bold headland west of the south end of Sandy Hook, in Monmouth Co., N. J. (Map. New Jersey, D 3). They are important landmarks for ships approaching New York. On them is installed a first-class lighthouse, which shows a flashing white light, 246 feet above the sea, and visible for $22\frac{1}{4}$ nautical miles. The adjacent region, which is very beautiful and easily accessible from New York City, attracts many visitors.

NAVES LIBURNÆ. See LIBURNIA.

NAVEZ, ná'vá', FRANÇOIS (1787-1869). A Belgian portrait, historical, and genre painter. He was born at Charleroi and first studied under Joseph François. He was a pupil of the academies of Brussels and Ghent, and later studied with David, in whose manner his works are executed. From 1817 to 1822 Navez was at Rome, after which he settled permanently in Belgium, being made director of the Brussels Academy in 1839. His severely classic style is relieved by a touch of realism, and his portraits and drawings show considerable warmth of feeling. He is well represented in the Modern Gallery, Brussels, by eight portraits, including one of David, and four historical canvases. In the Rijks-Museum, Amsterdam, are "Elijah Raising the Shunamite's Son" (1821) and the "Meeting of Isaac and Rebecca" (1826). His "Spinning Women of Fondi" (1845) is in the New Pinakothek, Munich.

NAVIC'ULAR DISEASE (Lat. *navicularia*, relating to ships, from *navicula*, dim of *navis*, ship) A disease of the horse, consisting in an inflammation of the sesamoid sheath, induced by repeated bruising or laceration and complicated in many cases by inflammation and caries of the navicular bone, at the point within the hollow of the fetlock where it passes over the navicular bone. It is most common among the lighter breeds of horses, and especially where the pasterns are upright, toes outturned, and work is early and severe on hard roads. It soon gives rise to a short tripping yet cautious gait, undue wear of the toe of the shoe, wasting of the muscles of the shoulder, and projecting or pointing of the affected limb while standing. But few cases of navicular disease recover. Give rest, remove the shoe, shorten the toe, rasp the heel away, and apply hot poultices, changed every few hours, or a cantharides blister, repeated after three or four days. Laxative medicine and bran mash may be ordered. After a few days, and when the heat and tenderness abate, cold applications should be given; after another week the animal may be placed for two months in a grass field, where the ground is soft and moist, or, if sufficiently strong, at slow farm work on soft land. Division of the nerve going to the foot removes sensation, and consequently lameness, and hence is useful in relieving animals intended for breeding purposes or for slow work. The operation, however, is not to be recommended where fast work is required, for the animal, being insensible to pain, uses the limb as if nothing were amiss, and the disease rapidly becomes worse. Consult Leonard Pearson and others, *Special Report on Diseases of the Horse*, published by the United States Bureau of Animal Industry (rev. ed., Washington, 1907).

NAVIES (OF. *navie*, from Lat. *navia*, ship, variant of *navis*, Gk. *ναῦς*, *naus*, Skt. *nāu*, Olcel. *nōr*, ship, *naust*, naval station, connected with Gk. *νέω*, *neū*, to swim). The term navy is applied to the armed force of a country which operates on the water or in coast and harbor defense. The history of navies goes back to the earliest days of ships, for no sooner were such craft built than their value as weapons of war was at once seen. The Chinese were among the earliest of navigators, but little is known concerning their ancient fighting craft. The most ancient war vessels of which the details are known were those of the Egyptians, and the date assigned to them is 3000 B.C. At the same time it is evident that there were many other peoples that possessed fighting vessels, and that the Egyptians were far from paramount; for they had repeated naval combats with the Myrians, Phœceans, and Phœnicians, and probably also with the Pelasgians, Daunians, Oscans, Cretans, and Sicilians. It is therefore impossible to fix any sort of priority to the possession of naval defense. Herodotus says: "These Phœceans were the first of all the Greeks who undertook long voyages, and they are the people who discovered the Adriatic and Tyrrhenian seas, and Iberia and Tartessus [a part of modern Spain]. They made their voyages in fifty-oared galleys and not in merchant ships." At this time, and for a long time subsequent and anterior, the shapes of merchant and war vessels were quite different, the former being broad and suitable for carrying cargo and the latter narrow and sharp so as to make speed. In addition, war vessels were built with rams and other warlike appurtenances, while merchant vessels made a much greater use of sails.

The greatest seafaring people of antiquity were the Phœnicians. They occupied the coast of Asia Minor, but the coast alone, for their territory was only from 5 to 15 miles wide. Even this comparatively small area did not form a single state, for the Phœnicians were a race, not a compact nation, and usually consisted of several communities independent of each other. The principal cities were Tyre and Sidon, and each had its own government. From the founding of Tyre (about 2730 B.C.) till 1600 the Babylonian influence in Phœnicia was probably paramount. Then the country was conquered by Egypt, which held the suzerainty until the Egyptian power began to decline (about 1200 B.C.). From that time until 870 the Phœnicians were independent of foreign control and had command of the sea, both in a naval and commercial sense. Of their cities, Tyre ultimately took the lead in wealth and power, reaching its zenith about 1000 B.C., when "a Tyrian sea" became "a proverbial expression for a sea whose navigation was prohibited to all but those who claimed the ownership thereof."

In 870 the Assyrian advance to the west reached Phœnicia. From this time until 650 B.C. the Phœnician cities usually paid tribute to Assyria, but there were frequent unsuccessful revolts. Phœnician power was now waning, but so was that of Assyria. In 650 the Tyrians freed themselves from their suzerains, but the devastating wars of the past 200 years had so reduced the male population that, soon after the reassertion of independence, their slaves rose and seized the city. Then the Egyptians made themselves masters of the country, but in 605 the Chaldeans drove them out. Revolts continued, Tyre withstanding a siege of 13

years (587-574); but in 538 the country passed under Persian control without much fighting. Though the parent states were now absorbed into the Persian Empire, many of the colonies were flourishing. In the sixth century Carthage declared its independence, and, though it never attained the naval or commercial supremacy of Tyre, for several centuries it divided with the Greeks the control of the Mediterranean. At the end of the fourth century Alexander the Great conquered Phœnicia, the country lost its last semblance of self-government, and its trade and sea power passed to the Alexandrians, Greeks, and Carthaginians. During the various periods in which the Phœnicians formed suzerain states under great land powers they manned and operated the war vessels of their overlords, so that, to the external world, their naval power remained unbroken.

The Greeks were early competitors of the Phœnicians in trade and naval power. Like their rivals, the Greeks of Asia Minor passed through the same vicissitudes of subjection and acted as the naval forces of their conquerors. The European Greeks, equally good sailors, retained their independence and in the battle of Salamis (480 B.C.) overwhelmingly defeated the Persian fleet, which was largely manned by their Asiatic brethren. Internal dissensions prevented the extension of Greek sea power, the naval supremacy of Athens being destroyed in the Peloponnesian War (431-404 B.C.).

The early successes of Rome were on land. When it attempted to extend its conquests to Africa a strong naval force was necessary. In 260 B.C. the newly constructed Roman fleet destroyed the Carthaginian at Mylæ, and the overwhelming defeat of the Egyptian naval forces at Actium (31 B.C.) left Rome undisturbed mistress of the Mediterranean. The lack of opposition on the water caused the Roman naval force to be greatly reduced, and after the transfer of the seat of government to Constantinople, the navy almost disappeared until revived in the war against the Vandals. After the reconquest of Africa the fleet again declined. In the seventh century the rise of the Saracen power and the development of its naval forces compelled the Empire to build and organize an efficient fleet whose power and success were greatly augmented by the discovery of Greek fire (q.v.), the manufacture of which was kept a state secret. The dissensions in the Mohammedan world affected its naval forces, and their decline brought about a similar condition in those of the Empire. But in the ninth century the Saracens again gathered a strong force on the water, and the Imperial fleet was once more strengthened, and remained in this condition until the twelfth century, when the new Mohammedan conquests so reduced the territory of the Empire that its finances could no longer stand the burden of a strong navy.

In the meantime the commercial states of Italy had absorbed the greater part of Mediterranean sea-borne trade, and they built war vessels to protect it and to defend their coasts and colonies. Venice and Genoa were the leaders and rivals, and they, especially the former, were largely engaged in transporting the crusading forces to and from Palestine. They also settled at various places in the islands and on adjacent coasts, the settlement in many cases leading to seizure of the littoral and the formation of colonies. More than 200,000 were in Constantinople, and this indirectly led to the capture of

the city in 1204 and the formation of the Latin Empire dominated by Venice. After the Venetians were driven out the Empire again built up its fleet to some extent, but pressure from all sides soon caused the Imperial power on land and sea to sink to insignificance. Neither Venice, Genoa, nor the Mohammedan powers ever became paramount, though at times administering severe defeats to their opponents. The rivalry of Venice and Genoa came to an end in 1380 by the victory of Pisani at Chioggia, in which the Genoese fleet was destroyed and Genoese naval power so severely broken that it never fully recovered. Venice and the Mohammedans then continued their rivalry with varying success until the discovery of the passage around Good Hope caused the decadence of Venetian commerce and prosperity and the battle of Lepanto destroyed the Mohammedan sea power.

Early in the Middle Ages the countries about the Baltic and the North Sea, which had for centuries been sending out rovers and freebooters in every direction, began to develop organized naval forces. The early expeditions of the Norsemen showed this, though the actual warfare was mostly upon land. The ancient songs and stories of the Danes and Scandinavians contain many accounts of sea fighting, but these are so intermixed with fable, national boasting, and poetic imagery that it is difficult to separate fact from fiction. It is not until the ninth or tenth century that we begin to reach anything approaching reliable history. The Saxons (British) fought sea battles, in which many vessels were engaged, early in the ninth century, and in the last years of that century King Alfred organized a strong naval force. The first great sea fight of which we have any definite knowledge was that of Harald Haarfager, King of Norway, against the petty kings of the northern part of the country. He spent three years in building ships and gathering men, but achieved a complete victory in 872. One of the greatest of the early sea fights of which we have full information was that between Olaf Trygvasson, great-grandson of Harald, and the allied powers of Denmark and Vendland, which were assisted by the Norwegians of the Province of Viken. Olaf's ships were numerous and some of them were 150 feet in length, but the forces of his opponents were still greater, and, though he made a brave and able defensive fight, he was defeated and killed. In 1014 Olaf the Saint assisted the Saxons to capture London, which was occupied by the Danes. This fight is interesting from the fact that it was made by a fleet fighting against land forces. Under Harald Haardraade, in 1061, the Norwegian fleet destroyed the Danish in a fiercely fought action at Nisaa. Harald then started with a fleet and an army to invade England, ostensibly to place Earl Tostig, the brother of the British King Harold, upon the throne. The enterprise was unsuccessful and Harald was killed at the battle of Stamford Bridge, Sept. 25, 1066, three days before the landing of the Normans and less than three weeks before the battle of Hastings. After the death of Harald Haardraade the Norse sea power declined, though in the next century King Sigurd led an expedition into the Mediterranean, which was successful against the Moors in Spain and against the pirates of the Mediterranean and which, in alliance with Baldwin I of Jerusalem, took and sacked Sidon.

Spain made a strong effort to become a great maritime nation, but ultimately failed, partly from governmental mismanagement, partly from various causes connected with the temperament of her people or with the country's environment. In 1588 she sustained a crushing blow in the defeat of the "Invincible Armada," which was organized to conquer England.

Long before this, however, Neptune's sceptre had definitely passed to northern nations, the English and the Dutch. But good sailors as the Dutch were, they were too few in number and too poor to cope long with their great rival, and Britain became mistress of the waves. Alfred the Great is commonly regarded as the founder of the British navy. A naval force had existed before his time, but it lacked the organization and effectiveness of the fleet developed by Alfred, in which the vessels were especially designed for fighting and were adapted to the country's needs. Alfred's grandson Athelstan fostered the maritime spirit of his people as regards both commerce and naval affairs. He granted the title of thane to any merchant who had made three voyages on the high seas in his own ships freighted at his own expense, though this was a title previously confined to men of noble rank and extensive landed possessions. Edwy the All Fair is said to have had large fleets; and under Canute the Great English maritime commerce assumed large dimensions. After the Normans had firmly established their rule they also encouraged the growth of shipping and provided for its defense. Henry II and Richard Cœur de Lion are both known to have had strong naval forces, and under John it was decreed "that any ships of other nations, though at peace and in amity with England, should be made lawful prizes if they refused to strike to the royal flag." Such an arrogant assumption is not likely to have been made unless the power to enforce it had existed, and we know that John's fleet gained a victory over the French in the harbor of Damme.

During the century which followed a sort of piratical war existed between England and France and the coasts of both were ravaged by the freebooters on either side. At length, in 1340, the English fleet, commanded by Edward III in person, won the great victory of Sluys. The French losing nearly their whole force of 300 vessels besides 20,000 men killed, wounded, and prisoners. According to Charnock this was the first action in which beaked galleys propelled by oars were wholly laid aside and reliance placed upon vessels propelled chiefly by sails. From this time there was no particular improvement in the British navy (except that heavy guns were placed on board ship) until the reign of Henry VIII, who gave great attention to the fleet, improving the ordnance, reorganizing the personnel, and building several relatively very large vessels, the most powerful being the *Henri Grace à Dieu*, commonly called the *Great Harry*. She carried 72 guns and 700 men, and her tonnage was between 1000 and 1500, the lack of uniformity in measurement for tonnage at that time making it difficult to ascertain the correct figures.

Henry was the first sovereign in Europe to establish a corps of officers for sea service only, and he did more to improve the navy than any preceding monarch, using improved models for his ships and employing Italian shipwrights (then the best in the world) in their construction. The construction and mounting of the

heavy guns were improved to such an extent that the design of both the guns and the gun carriages used in the later ships of his reign remained unchanged for nearly 200 years. He also greatly increased the number of vessels and established the dockyards at Woolwich, Portsmouth, and Deptford. Edward VI and Mary paid but little attention to the fleet, but Elizabeth recognized its vital importance, again increasing the number of ships and their size besides improving the condition of the officers and gathering vast quantities of naval stores. From her reign until the present day the British navy, though not without rivals, has never been equaled but once or twice, and then the equality was of very short duration.

In this brief review of the history of ancient and mediæval navies only those are considered which have been of greatest importance in the different periods or have demanded recognition for other reasons. This has excluded a considerable number from mention except so far as their histories are bound up with the histories of others. The greatest apparent omission is in the case of France. Her navy has always been respectable and occasionally very powerful, but it has never been paramount and its effectiveness and prestige suffered at times from defeats brought about by governmental neglect and mismanagement. It has not been to France what that of Great Britain has been to the British Isles and Empire—an absolute necessity—and has been built up or allowed to fall into comparative impotence according to the prevailing views of the government.

Modern naval development may be said to have begun with the rapid increase in the size of ships which took place at the end of the fifteenth century and the contemporaneous improvement in ordnance (see GUNS, NAVAL), and mediæval naval history finally closed with the battle of Lepanto, the last great action in which oar-propelled galleys played an important part. From this time the sailing man-of-war was gradually improved in size, speed, and power until near the middle of the nineteenth century, when sails were replaced as a motive power by steam. During the whole of this period the British navy maintained its supremacy, though the temporary rise of the Dutch naval power in the seventeenth century seriously threatened it for a short time, and during a brief interval under Louis XIV the French maintained a fleet which was superior to the British, and with which Admiral Tourville defeated the combined British and Dutch forces off Beachy Head in 1690. Two years later the French fleet was destroyed by the same allies at La Hogue. Thenceforward the superiority of the British navy has been unquestionable. Though it lost many single-ship actions and minor engagements with the French and Americans, no navy could stand before its full strength.

At the close of the Napoleonic wars the great naval powers were Great Britain (far in the lead) and France. In the second rank were Spain, Russia, and the Netherlands. In the third were Turkey, Austria, Denmark, Norway, Sweden, the United States, the Two Sicilies, Portugal, and Prussia. In 1860 the conditions were much the same except that the United States had risen to the second category, the Netherlands had sunk to the third, the Kingdom of Italy was forming and the Two Sicilies tottering to its fall; while Greece, Brazil, Peru, Chile, and Argentina had organized naval forces.

During the period 1860-80 the naval powers of the world underwent many changes. During the Civil War the navy of the United States became enormously expanded, but the greater part of the ships were of no permanent value except for the special and unusual conditions existing in that struggle. At the close of operations all such craft were sold and many of the others laid up. Congress addressed itself to the task of reducing the debt and government expenses; and the naval appropriations were so greatly cut that the navy declined steadily until 1881, when it reached a condition of absolute nullity so far as the ships were concerned. Three new naval powers appeared in this period—Germany, Italy, and Japan—and one, the Two Sicilies, was suppressed. In 1867 the North German Confederation took over the Prussian navy and somewhat enlarged it. Some additions were made during the decade following the establishment of the Empire, but these were so moderate in amount that in 1880 it was still in the second rank of naval powers. The early history of the Italian service was different. Sardinia had begun to build a strong fleet before it became the Kingdom of Italy. The navy of the Two Sicilies was absorbed in it, but was no addition, and perhaps its inefficient condition rendered its incorporation detrimental to Italian naval efficiency. The vessels built between 1860 and 1866 were, however, very excellent for their date, and at the opening of the War of 1866 Italy was a naval power of the first rank. The disastrous battle of Lissa then caused a cessation in naval development, which continued until 1871, when Italy resumed building on a scale that brought her up to third or fourth in naval power in 1880. Russia started to reconstruct her fleet soon after the close of the Crimean War, but the vessels built previous to 1880 were not very formidable for seagoing purposes. Japan took a first step towards building up a navy by the purchase of the armored ram *Stonewall*, built for the Confederate government, in 1865. Four other small armor-clads and a few cruisers were acquired previous to 1880, but no hint of her naval ambitions had appeared at that time. The Turkish navy was reorganized in 1863, and from that time until the war with Russia (1877-78) it was being steadily strengthened by the addition of armored ships. The financial difficulties brought about by the war put an end to large naval expenditures for many years. Not only were no new vessels ordered, but the old ones were allowed to deteriorate until practically worthless.

The period of 1880-1900 was one of general naval renaissance. Powerful navies were greatly strengthened, weak navies made powerful. During this period France, Italy, and Russia built quite steadily, Italy and Russia gaining in relative power, France holding her own in 1880-90, but losing in the next decade. In 1889 Great Britain passed her first Naval Defense Act, providing for 70 vessels, 10 of which were battleships of the first class; and in the same year Germany adopted a five-year programme providing for four first-class battleships (the first ones in the German navy) and nine armored coast-defense vessels. The United States began the new navy in 1882, and Spain ordered her first battleship in the same year. In 1888 Greece and Chile ordered second-class battleships. During the second decade of this period the development of the various fleets proceeded rapidly. The United States and Germany made the great-

est progress, nearly passing France at the end of the decade, and gaining in relative strength with respect to all powers except Great Britain, which soon adopted the policy of maintaining a navy equal to any two others combined. Russia and Italy retrograded slightly, especially the latter. Japan ordered two first-class battleships (her first of the kind) in 1893, and then began building rapidly. Austria laid down her first battleships in 1899, and Argentina placed orders for her first important ships (four armored cruisers) in 1895. In the period 1900-15 the rapid augmentation of naval power has continued. Great Britain maintains her commanding lead. In the United States the large appropriations in the years following the Spanish-American War brought the navy up to second place early in the new century, but in 1910 she was passed by Germany and in 1915 she was considered to have fallen behind France. The defeat of Russia and the destruction of her fleet by Japan put the latter in fifth place. Russia's large programme of construction was to give her sixth place when completed, Italy being a close rival, and Austria, which had been building rapidly, not far behind. Argentina, Chile, Brazil, Greece, Spain, and Turkey had all acquired or built battleships or battle cruisers since 1910, and the Netherlands was about to order several such vessels when the Great War broke out in 1914.

Questions of much interest have been raised concerning the relative importance and efficiency of the naval weapons of to-day, especially the battleship, the battle cruiser, the submarine, and air craft. It was to be hoped that the full capacities and limitations of each would be developed in the war. Until these questions are settled the proper design of future fighting ships will remain in doubt.

NAVIES OF TO-DAY

The strength and composition of the fleets of the Great Powers and the other nations of the world, whether influenced by war or merely by natural development, are constantly changing, but the accompanying paragraphs and the table on page 658 will indicate the comparative positions of the various countries in 1915-16. In some cases reference should be made to the articles on the various nations, while one interested in naval progress and operation will turn to the discussion of the work of the fleets as outlined under WAR IN EUROPE.

Argentina. Though possessing a small naval force for many years, it was not until 1874 that Argentina acquired armored vessels—two river monitors of 1550 tons. Shortly after this the navy was reorganized and placed on a more permanent footing. In 1878 a small third-class battleship (4200 tons) was ordered, and this was followed by two larger monitors and several protected cruisers about 1890. In 1895-98 four armored cruisers of 7000 tons were ordered in Italy; in 1910 contracts for two battleships of 30,000 tons were placed in the United States, and these battleships were duly delivered. In addition to three cruisers of 3200 to 4500 tons, the navy has a number of gunboats, torpedo vessels, and auxiliary ships. Seven destroyers were in service in 1914, and eight more which were building in Germany and France were taken over by the government of those countries at the outbreak of war. There were also in 1914 about 20 torpedo boats, but they were old

and slow, and many were unfit for service. The naval budget for 1914 was \$13,000,000, an increase of \$1,500,000 over that of the previous year. This sum was exclusive of \$900,000 for replacing old vessels by new, \$700,000 for reserves of coal and oil, and \$1,400,000 on account of the four destroyers building in Germany. The *personnel* for 1915 consisted of 316 officers of the executive branch, 4 naval constructors, 29 medical officers, 93 engineers, 2 torpedo engineers, 21 electrical engineers, 78 paymasters and commissary officers, 8 chaplains, and 9351 petty officers and men. The effective force in time of war is fixed at 18,500. The navy yards are at Puerto Belgrano in Bahía Blanca and at Santiago in Puerto Plata. The naval station at Tigre, near Buenos Aires, is a supply and repair establishment and the headquarters of the torpedo fleet. The Argentine is the most powerful of the South American navies, though it has very little lead over that of Chile, and will be inferior to that of Brazil when the battleship building in 1915 for the last-named power is completed.

Austria-Hungary. Until quite recently the navy of the dual monarchy has been of little importance. In 1860 several small ironclads were begun, but all had wooden hulls and 15 years later had become unseaworthy. The battle of Lissa (July 20, 1866), in which an Austrian fleet ignominiously defeated a vastly superior Italian force through the inefficiency of the Italian admiral, gave the service an enormous prestige and brought it strongly into favor with the nation at large. New vessels were built and the fleet strengthened materially, but the small coast line, moderate merchant marine, paucity of sailors, and the importance of the army prevented the formation of a powerful fleet notwithstanding the strength of the Italian navy, which was, a few years after the close of the War of 1866, so extensively enlarged as to make it one of the greatest in Europe. The development of the Austrian navy as a power of importance began in 1899 with the laying down of three small battleships of 8200 tons. In 1901 three of 10,500 tons were commenced, in 1907 three of 14,300 tons, in 1910 four of 20,000 tons; and in 1914 four of 24,500 tons. All except those of the last group were completed when the war began, so that Austria became one of the principal sea powers, not greatly inferior to Italy. Until 1911 the navy was the marine section of the Ministry of War, but in that year it was organized as a separate department and its head given ministerial rank. In 1862 the Archduke Maximilian succeeded in founding a marine ministry when he was appointed to control the fleet, but after his departure the old system was reestablished and continued until 1911. The budget for 1914-15 was 177,266,710 crowns (\$35,985,143 13), which included \$20,503,000 for new construction and attendant expenses, the principal items being: 4 battleships of 24,500 tons, 3 scout cruisers of 4800 tons, 6 destroyers of 800 tons, 2 river monitors of 500 tons, 1 submarine of 700 (surface) to 1070 (submerged) tons; the completion of ships building, and the reconstruction of the older battleships. The vessels under construction at the outbreak of the war were: 2 battleships of 24,500 tons (commenced), 2 battleships of 20,000 tons (practically completed), 3 scout cruisers of 3500 tons (2 practically completed), 3 submarines, building in Germany (sent overland

in sections), 1 submarine (ordered), 2 river monitors (nearly finished), 2 river monitors (ordered), 1 fuel ship of 12,000 tons, 1 mine vessel, 6 destroyers of 800 tons (nearly completed), and about 25 torpedo boats of 250 tons. The *personnel* of the navy for 1914-15 was as follows: 1 commander in chief of the navy, 1 admiral, 4 vice admirals, 14 rear admirals, 32 captains, 39 commanders, 63 lieutenant commanders (*capitaines de corvette*), 303 lieutenants, 152 sublieutenants, 46 ensigns, 106 midshipmen, 127 cadets, 23 paymasters, 12 chaplains, 88 surgeons, 30 naval constructors, 41 designing engineers, 153 marine engineers and machinists. The enlisted force consisted of 19,538, of which 35 per cent were Croats, 21 per cent Hungarians, 15 per cent Italians, 12.5 per cent Germans, 9 per cent Czechs, 3 per cent Poles, 3 per cent Slavs, 2 per cent Rumanians. The normal organization of the fleet was two divisions of three battleships each and a cruiser division. The other vessels were held in reserve. The only dockyard is at Pola, but there are naval stations at Trieste, Fiume, etc.

Brazil. The navy of Brazil is the oldest of the South American naval establishments, having existed before the other states broke away from Spain. Counting ships under construction in 1915, it was the most powerful navy of the western continent with the exception of that of the United States. Its development has been greatly disturbed by politics, and it is one of the few naval services which have assisted in overturning an existing government. It played an important part in the overthrow of the Brazilian Empire, and has twice since supported unsuccessful revolutions. The first armored vessels of the navy were built in 1864-65, but they were small and weak. Two large heavily armored monitors and a larger central battery ship were launched in 1874-75, and these were followed by the armored cruisers *Aquidaban* (5000 tons) and *Riachuelo* (5700 tons) in 1883-85. Two monitors of 3100 tons were built in France in 1900-01. In 1907 the following programme for new construction was adopted. 3 battleships of 19,000 tons, 3 scout cruisers of 3100 tons, 15 destroyers of 650 tons, one mine-laying ship of 1500 tons, 3 submarine boats. Of these, 2 battleships, 2 scouts, 10 destroyers, and 3 submarines are in service. Instead of building a mine layer, the small cruiser *Republica* was transformed into one and a submarine repair ship and dock of 3735 tons were constructed. A third battleship of 30,000 tons was building in 1915 at the works of Armstrong, Whitworth & Co (England). Three river monitors of 1200 tons were built, but were found to have too great draft of water and were sold to the British government in 1914. When the new battleship is commissioned the Brazilian will be the strongest of South American navies. The principal navy yard is at Rio de Janeiro, as are also the naval academy (see NAVAL SCHOOLS OF INSTRUCTION), the school for naval apprentices, and the torpedo school; but there are also naval stations at Pará, Pernambuco, Santa Catalina, Ladaraes (Matto Grosso), and Bahia. In addition to the vessels mentioned Brazil had 2 armored coast-defense ships of 3112 tons (built 1896-97), 1 cruiser of 3450 tons (1896), 1 training cruiser for cadets of 2700 tons (1892), 3 torpedo gunboats of 1050 tons (1898) and one of 500 tons (1892), 2 river monitors of 463 tons (1905), 2 gunboats, and 5 old torpedo boats.

The naval budget for 1914-15 was about \$15,000,000.

Bulgaria has one torpedo gunboat of 700 tons, 6 torpedo boats of 100 tons, 1 gunboat of 800 tons (used as a gunnery and torpedo school ship), and a number of small craft.

Chile. Of the navies of South America, that of Chile is third, measured by the strength of its fleet, but the navy has an excellent reputation for efficiency and in war it would probably be found equal to that of Argentina or of Brazil. The war college (recently established) and the naval school for officers are at Valparaiso. The principal dockyard is at Talcahuano, though there are naval stations at Valparaiso, Punta Arenas (Strait of Magellan), and Arica. The naval budget for 1915 was about \$10,000,000, and provided for a total *personnel* of 7000 officers and men. The fleet consisted of 1 battleship of 28,500 tons (a sister ship was building in 1915 in England), 1 small battleship of 6900 tons (launched 1890, rebuilt 1908), 1 small battleship of 3500 tons (1874, rebuilt 1900), 2 armored cruisers (1 of 7000 and 1 of 8500 tons), 2 cruisers of 4300 and 4420 tons (1898 and 1893), 1 small cruiser of 2050 tons, 2 torpedo gunboats, 2 destroyers of 1850 tons and 31 knots (4 others building), 6 older destroyers (1896-1901), 16 old torpedo boats (1880-98), 2 submarines (1915), and older vessels used as training ships, gunnery and torpedo school ships.

China. The navy of China in 1915 was undergoing reorganization after a long period of disintegration and lack of attention. There is little prospect, however, that the present arrangements will result in the building of a navy of adequate size or effectiveness or develop any measures of importance. The conditions in China are such as to preclude great expenditure on the navy or the adoption of permanent plans for its upbuilding. Among the few remaining features of interest belonging to the service in its best days are the naval schools located at Chifu, Nanking, Fuchau, Wusung, and Canton. The most important of these is in fine quarters at Chifu. The whole course of training is free. The age of admission is 12 to 16 years. The course includes English studies, geography, mathematics, ordnance, navigation, etc. There are 16 instructors and 192 pupils. Three practice ships are provided for this and the other schools. The Nanking school in 1915 was being readjusted, and six English naval officers as instructors have been applied for. These schools provide officers not only for the navy but also for the merchant marine. The Chinese navy consisted in 1915 of 3 cruisers (building at Trieste) of about 3500 tons, 2 cruisers of 2500 tons, 3 cruisers of 3000 tons, 1 cruiser of 4300 tons, 3 torpedo gunboats of 850 tons, 4 destroyers, and 8 torpedo boats. These are modern vessels. There were also some gunboats and river craft of no naval value.

Colombia. The navy of Colombia consists of 1 small cruiser of 1200 tons, 1 armed merchant steamer, 2 armed yachts, and some small craft.

Costa Rica. The only war vessel possessed by Costa Rica is a small torpedo boat built by Yarrow in 1892. It is probably unfit for service of any kind.

Cuba. The navy consists of 1 cruiser of 2055 tons (launched 1911), 1 cruiser of 1300 tons (1911), 1 yacht (for the President), 7 gunboats of 175 to 500 tons (1895-1911), and a number of small craft of no naval value.

Denmark. The Danish navy is one of the oldest in Europe. Denmark possessed naval forces before France became a kingdom and while Great Britain was a collection of petty monarchies. It has passed through many wars against superior power, but has emerged from all with honor and sometimes with success. It was the first to build a seagoing turret ship, and its constructors were among the first to design practicable submarine boats. Though necessarily small, the present Danish navy has an excellent reputation as regards organization and efficiency. At the head of it is the Minister of Marine, who is assisted by an officer of rank (usually a vice admiral or rear admiral) who has the title of director general. The navy department is divided into four principal sections: (1) Secretariat, (2) Admiralty, (3) Commissariat and Accounts, (4) Justice. The chief of the Secretariat is the director general, of the Admiralty, a captain in the navy. The other two sections have civilian heads. The only dockyard is the royal arsenal, Copenhagen. The fleet consisted in 1915 of 6 (1 building) small coast-defense ships of 2200 to 4000 tons, 4 cruisers of 1270 to 3000 tons, 7 gunboats of 200 to 1000 tons, 31 torpedo boats, 12 (6 building) submarines. The other vessels include training ships for seamen and mechanics, torpedo school, mine-laying boats, etc. The naval academy for the education of the executive officers is at Copenhagen, the postgraduate schools in torpedoes, gunnery, and aviation are also located there, as well as the headquarters of the training vessels for seamen and mechanics. The budget for 1914 provided for 1 vice admiral, 2 rear admirals, 17 captains, 45 commanders, 72 oberoffiziere, and 7200 junior officers and enlisted men.

Ecuador. The navy of Ecuador was organized in 1908 and greatly strengthened by the purchase at this time of a cruiser of 3600 tons and a torpedo gunboat of 858 tons from Chile. Nevertheless, its force is negligible, as the only other vessels are an old gunboat of 800 tons bought from France in 1900 and a few small craft.

Egypt. Egypt has no navy in the proper sense of the word, but it has a large number of river gunboats and coast-guard vessels, a transport of 3700 tons, and a royal yacht. The final separation from Turkey, which took place in the latter part of 1914, and the definite suzerainty of England may result in the organization of a force for the protection of the coast and the Suez Canal.

France. The success of the French navy in war has never been proportional to its strength in ships, guns, and men. This has been due to disturbing and disorganizing forces from without the service which have prevented efficiency. From the fourteenth century to recent times it was, with the exception of very brief intervals, the second naval power in Europe, and twice, for a few years, it was the most powerful. In 1860 it was nearly on a par with the British, but from that time onward it relatively declined, especially between 1885 and 1902. During this interval a cheap substitute for the battleship was sought—first the torpedo boat, then the cruiser and the *guerre de course*, and lastly the submarine. But in 1902 battleship construction was begun in earnest, and the disorganizing influences which had existed for several years were eliminated. But before the new building

policy had made great headway the navy had fallen behind both Germany and the United States. Though Germany in 1915 was still ahead, France again passed the United States and was in third place. The building programme in force in 1915 was to provide 10 dreadnought battleships and 8 superdreadnoughts in 1916 and 4 more of the latter in 1917. Though possessing a number of large armored cruisers, the navy possessed neither battle cruisers nor light fast cruisers. The submarines were numerous, but most of the older ones are fit for harbor defense only. For further description, see FRANCE, *Navy*.

Germany. The German navy is fully described under the head of GERMANY, *Navy*. The operations of all navies in the great European War are given under WAR IN EUROPE.

Great Britain. The navy of Great Britain is fully described under the head of UNITED KINGDOM OF GREAT BRITAIN, etc.

Greece. The Greeks have always been a seafaring people and they organized a navy soon after the establishment of an independent government. Though a couple of small armor-clads (1700 and 2000 tons) were built in 1867-69, the government first began to consider the possible use of naval power after the destruction of the Turkish fleet in 1877-78 and it became evident that Turkey was unable to restore it. Between 1880 and 1885 half a dozen torpedo boats were purchased. In 1886 three small but well-armed battleships of 4800 tons and 17 knots' speed were ordered (completed 1889-90) and they were reconstructed in 1897-1900. In 1908 a large, powerful, and fast armored cruiser of 10,000 tons was ordered in Italy and was of great service in the Balkan War. A battle cruiser of 19,200 tons, eight 14-inch guns, and 23 knots' speed was building in Germany at the outbreak of the war in 1914 and presumably was taken over by Germany to be added to her fleet. A battleship of 24,000 tons, 22 knots' speed, and carrying ten 14-inch guns was ordered at St. Nazaire, France, in the spring of 1914, and in June the battleships *Idaho* and *Mississippi* of 13,000 tons and 17 knots' speed were purchased from the United States. In addition to the ships mentioned, Greece had 1 new 2600-ton cruiser, 1 old cruiser of 1800 tons, 5 gunboats, 3 small mine layers, 14 destroyers, 13 torpedo boats, 3 submarines, and some old vessels of no naval value. Six destroyers were under construction in Germany when the war began. In 1913 a number of British naval officers headed by Rear Admiral Kerr were lent to the Greek government for the purpose of reorganizing the navy. The Greek authorities, with their advice and assistance, planned an extensive programme of construction which was approved by the Greek parliament. This programme subsequently was added to and in 1915 was reported as follows: 1 battleship, 2 battle cruisers (exclusive of the one building in Germany), 2 other cruisers of 10,000 tons, 25 destroyers, 6 submarines, 12 gunboats, 20 hydro-aeroplanes, and 1 depot ship. It was reported in 1915 that the two cruisers of 10,000 tons had been eliminated from the list in view of the purchase of the *Idaho* and *Mississippi*. The rapid changes in the strength of the fleet and of the building plans caused great fluctuations in the budget and in the *personnel*. Owing to the payments for the two battleships and the vessels building, the naval expenditure for 1914 prob-

ably exceeded \$20,000,000, but was to be considerably less in 1915. The total *personnel*, officers and men, possibly reached 6000 by July 1, 1915. The budget for 1915 provided for the following officers of the executive branch: 2 vice admirals, 3 rear admirals, 20 captains, 24 commanders, 32 lieutenant commanders, 139 lieutenants, 90 sublieutenants, and 47 midshipmen. The naval dockyard (and headquarters of the fleet) is at Salamis, but a new dockyard of high class is to be built at Eleusis (Levings), on the Gulf of Salamis, at a cost of \$15,000,000, after plans by the British commission. The enlisted men of the navy are obtained chiefly by conscription, and serve two years in the active fleet and four years in the reserve.

Haiti. The navy of Haiti consists of an old cruiser (2245 tons, 18 knots) purchased from Italy, 4 armed steamers of 600 to 1200 tons, 1 gunboat of 514 tons and 2 of 256 tons, and the President's yacht.

Italy. The Italian navy is fully described under the head of ITALY, *Navy*. The naval budget for 1915-16 was 283,717,686 83 lire (\$54,757,513 56), an increase of about \$4,500,000. The enlisted force was 39,000, an increase of 1000.

Japan. The Japanese navy is fully described under the head of JAPAN, *Navy*. A commission of 26 members, presided over by the Deputy Minister of Marine, in 1915 was preparing plans for the reorganization of the navy department. During 1914 the aviation department was organized and Yokohama was selected for its headquarters, works to be completed in 1916. The number of aeroplanes in service in 1915 was 10, but this number was to be largely increased. One dirigible was obtained in 1912, others were being built as fast as shelters were constructed for them at the new station.

Mexico. Until 1901 the navy of Mexico consisted of a small cruising training ship of 1200 tons (launched 1891) and four gunboats. In that year a building programme was approved which provided for eight gunboats of 1000 tons and two torpedo boats. Pursuant to this programme two gunboats of 980 tons and 16 knots' speed were built at Elizabethport, N. J. In 1903 two small cruisers were built in Italy. In place of the other four gunboats two small cruiser transports of 1565 and 1850 tons were ordered—one in Italy, one in England. Four torpedo boats in 1915 were building in Italy. Four small gunboats (250 to 400 tons) and several merchant steamers were in service. The insurrections in Mexico disorganized the naval service, one of the 980-ton gunboats having been destroyed and other vessels greatly injured.

Montenegro has no navy, but the King has a royal yacht manned by governmental officers and men.

Morocco has three gunboats and two revenue vessels, but no organized navy.

Netherlands. In the days of sailing vessels the navy of the Netherlands was a powerful one. During the rebellion against Spain in the latter part of the sixteenth century the vessels of the Dutch were of great assistance to the shore operations. As the contest went on the sea forces became strengthened and organized. In 1607 the Dutch Admiral Heemskirk destroyed the Spanish fleet at Gibraltar. This brought about a truce of a dozen years and permitted the great and growing merchant marine of the United Provinces enormously to extend its scope

and importance. The navy grew with the merchant service, and during nearly the whole of the seventeenth century both contended on equal terms with those of England. In 1639, during the renewed war with Spain, Admiral Martin Tromp annihilated a Spanish squadron off the Flemish coast, and seven months later defeated and dispersed the combined Spanish and Portuguese fleets off the British coast. In the period 1652-76 the Dutch fought many actions with the British and French fleets. In the majority of these they were victorious. In 1665 De Ruyter defeated the British fleet and compelled it to take refuge in the Thames, and in 1667 he entered the Medway and destroyed the British fleet as it lay at anchor. The union of England and the United Provinces relieved the Dutch from the strain of maintaining a very powerful navy, and during the next century it greatly declined. In the Napoleonic wars the Netherlands lost its independence and its fleet, and since that time it has never been a naval power of importance. The navy is represented in the Netherlands cabinet by the Minister of Marine. The administration, presided over by the Minister, consists of a chief of the general staff (a captain or rear admiral), a director of naval construction, a director of *personnel*, a director of pilotage, a director of the hydrographic service, an inspector of pay, provisions, and clothing, and a medical inspector. The naval academy for the education of officers of the executive branch is at Willemsoord; the engineer school is at Hellevetsluis. The fleet is manned partly by voluntary enlistment and partly by conscription. The *personnel* of the navy was fixed at 11,164 for 1914, but the outbreak of the European War caused this to be increased. The home dockyards and naval stations are at Amsterdam, Hellevetsluis, Willemsoord, and Fijenoord, in the colonies there are naval stations in Java, Sumatra, Celebes, Borneo, Surinam, and Curaçao. The fleet in 1915 consisted of 6 small battleships of 5000 to 6525 tons, 4 coast-defense armor-clads of 2500 to 3500 tons, 2 monitors of 2000 tons, 6 cruisers of 3900 tons, 8 destroyers, 50 torpedo boats, 7 submarines, 3 armed gunboats (antidestroyers), 2 mine layers, 1 submarine depot and salvage ship, a large number of gunboats for service at home and in the colonies, and many old vessels used for school ships, training ships, guard ships, etc. The naval budget for 1914 was \$9,500,000, and provided for the construction of 2 submarines, a submarine depot and salvage ship, and 8 destroyers. A royal commission, appointed in 1913, recommended the building of the following vessels: 9 dreadnought battleships of 21,000 tons, 6 36-knot destroyers, 8 other destroyers, 44 torpedo boats, and 22 submarines. The project would require a number of years for completion, at an annual cost of about \$19,000,000. Two fast cruisers of 6000 tons and 4 submarines of 800 tons were ordered early in 1915.

Norway. In proportion to its population Norway has a larger mercantile marine and a greater seafaring population than any other country in Europe, but the cost of modern fighting ships prevents the maintenance of a naval force beyond what is barely adequate for the defense of the coast against ordinary aggression. The government of the navy is confided to the Minister of Marine and Posts and the commanding officer of the navy. The former is

an administrative office and constitutes the ministry proper; both branches have their headquarters at Christiania. The commanding officer of the navy is a rear admiral, who is a Councillor of State, and he is assisted by a captain. The executive officers of the active service and of the reserve are educated at the royal naval school. Norway has but a single military and naval port, that of Horten, near Christiania. There are five naval stations, of which that of Karljohansvaern at Horten is the only building yard. The others at Bergensund, Trondhjem, Frederiksvaern, and Kristiansand are naval depots and supply stations, though the last named has a dry dock. The dockyard at Horten is being extended for the purpose of building larger vessels, marine engines of the Diesel type, and aeroplanes. The fleet consists of 4 armored coast-defense ships (3556 to 3850 tons), 2 similar ships of 4430 tons building in England, 2 monitors (1500 and 2000 tons), 2 small cruisers (1100 and 1400 tons), 4 destroyers, 38 torpedo boats, 4 submarines, and a number of gunboats, training ships, etc. Four submarines are building in Germany and England, but have probably been taken over by those governments as a war measure. The budget for 1915 is \$2,145,100, a large part of which is devoted to the fortification of the principal ports. In addition, immediately after the outbreak of war, a special naval act was passed appropriating \$4,020,000 for the national defense. The active force of the navy was about 1800 officers and men at the outbreak of war in 1914, but this has probably been considerably increased.

Panama. The naval force of Panama consists of three small gunboats (400 to 643 tons) and a large harbor launch. All formerly belonged to Colombia.

Persia has an armed merchant vessel of 1200 tons, a gunboat of 379 tons, and the royal yacht of 400 tons.

Peru. Peru was one of the first of South American states to organize a navy. At the time of the war with Chile it had an armored frigate, a small seagoing turret ship, and a large monitor, besides several unarmored vessels. These were all captured or destroyed, and it was not until 1903 that any very serious attempt was made to create a new naval force. In 1915 the navy included 1 armored cruiser of 6300 tons (ex-French *Dupuy de Lôme*), 2 scout cruisers of 3200 tons, 1 destroyer of 500 tons, 3 submarines, 1 old cruiser of 1700 tons, 1 transport of about 1800 tons, 1 old wooden cruiser of 1658 tons, and several steamers of no naval value.

Portugal. From time to time plans have been made for increasing the strength of the Portuguese fleet, but, aside from acquiring an occasional cruiser, the financial resources of the country have been unable to meet the demands of the naval programme. The navy department forms part of the Ministry of the Marine and Colonies. It is presided over by a vice admiral with the title of director general, and consists of the divisions of (a) *personnel* and (b) *material*. The only naval arsenal is at Lisbon, where is also located the naval college, a sort of polytechnic institute in which all the officers of the navy are educated, even the medical officers having a final course there. The fleet in 1915 consisted of 1 old armored coast-defense ship (rebuilt 1902) of 3165 tons, 1 cruiser of 4100

tons, 3 cruisers of 1700 tons, 1 old cruiser of 1100 tons, 3 destroyers, 4 torpedo boats, 1 submarine, 1 mine layer, 25 gunboats of 38 to 750 tons, and a number of miscellaneous vessels of no particular value except as transports, hulks, and depot ships.

Rumania. The Rumanian navy department is a branch of the Ministry of War. The officers held military titles and were overshadowed by the army in every way, but in 1914 a reorganization of the navy was decided upon. This has not proceeded far enough to determine its full character, but a naval school was planned to be established at Kustendje, and 18 officers, selected for instructors, were sent abroad for special study. Heretofore a military education was apparently considered sufficient for the naval officers. A new building programme was also decided upon. This consists of 6 scout cruisers of 3500 tons, 8 destroyers of 1500 tons and 35 knots' speed, and 8 monitors (4 of 1200 tons) for the Danube. The harbor of Mangalia was to be made a military and naval port, the principal dockyard was to be built there, and it would be made the naval base. The harbor is deep and is in the form of a lake connected with the Black Sea by a narrow channel. The naval force of Rumania in 1915 consisted of 1 small cruiser of 1325 tons, 5 river monitors of 669 tons, 5 gunboats of about 100 tons, 3 gunboats of 45 tons, 4 destroyers (building, 1915) of 1450 tons, 11 torpedo boats, 1 torpedo school ship, 1 training brig, and a number of small craft.

Russia. A full description of the navy is given under RUSSIA, *Navy*. The operations of the navy during the Great European War of 1914 are given under WAR IN EUROPE.

Santo Domingo. The naval force of this little Republic consisted in 1915 of an old cruiser of about 1000 tons, a small gunboat of 322 tons, and 4 large motor boats.

Sarawak. The naval force consists of 3 gunboats of 118 to 300 tons and a small yacht.

Siam. The navy of Siam consisted in 1915 of 1 cruiser of 3000 tons (used as a royal yacht), 4 gunboats of about 500 tons, 3 destroyers, 3 torpedo boats, and a large number of river gunboats, paddle yachts, dispatch boats, etc. Many are of fair size, but nearly all the craft are old and some are useless.

Spain. The navy of Spain received a serious setback in the Spanish-American War, about half the fleet being lost. During 1901 the navy was reorganized and it was proposed to construct a new and powerful fleet, but the matter was delayed for some years. Finally in 1908 the following programme was voted by the Cortes: 3 battleships of 15,000 tons, 3 destroyers of 350 tons, 3 submarines of 300 tons, 24 torpedo boats of 180 tons, 4 gunboats of 800 tons, 3 fish-guard vessels of 157 tons. All these except the submarines were under construction before the end of 1913, and all were completed by 1916. In 1913 a second programme was presented to the Cortes and approved in the spring of 1914. It provided for 3 battleships of 21,000 tons, 2 scout-cruisers of 3000 tons and 28 knots' speed, 6 destroyers of 700 tons, and 8 submarines of 400 tons. It was proposed to follow this in about five years by a third programme, which would bring the number of battleships to 9 in 1926, with a corresponding number of other vessels. The naval bill of 1908 also provided for the reconstruction of the dockyards at Ferrol

and Cartagena. This was done, and all the new vessels were built at these yards. Many old and valueless ships were sold or broken up and the ineffective expenses of the service largely reduced. The navy is presided over by the Minister of Marine, formerly always a naval officer, now occasionally a civilian. He is assisted by a council of persons, of whom five are officers of the navy, one is a senator, one a deputy of the Cortes, one an inspector general of engineers, and one a field marshal of artillery. The central administration consisted of: (1) section of *personnel*; (2) section of equipment; (3) section of navigation and maritime industries; (4) section of naval construction; (5) section of naval ordnance; (6) section of accounts; (7) section of administrative affairs. The recent reorganization was reported to have made some changes, but the final plans were reported as not settled in 1915. The principal dockyards are at Ferrol, Cartagena, Cadiz (La Carraca), and Bilbao. The ordnance is made at Trubia (army gun factory). There are, in addition, several naval stations and supply depots. The royal naval school is located on the *Lepanto* (old protected cruiser of 4800 tons) and the *Isturias* (old wooden cruiser of 1575 tons). All executive officers are required to pass through the school, the course is three years, after which the cadets serve as midshipmen for further instruction. The fleet in May, 1915, consisted of the following: 3 battleships of 15,460 tons (1 not quite finished), 1 battleship of 21,000 tons (building commenced), 1 old battleship of 9740 tons (launched 1887, rebuilt 1899), 3 armored cruisers (2 of 6900 tons, 1 of 9900 tons), 1 protected cruiser of 5800 tons, 2 small cruisers (1920 and 2100 tons), 12 gunboats (600 to 1137 tons), 5 small gunboats (less than 300 tons), 7 destroyers (370 to 400 tons), several other destroyers building, 29 torpedo boats, several school ships, training ships, fish-guard vessels, and station hulks.

Sweden. The navy of Sweden was considerably increased after 1880, and the Great European War caused further additions. The navy is presided over by a Minister of Marine, with headquarters at Stockholm, the Minister is sometimes a naval officer, at others a civilian. The department consists of four bureaus, viz.: (a) cabinet of the Minister; (b) bureau of *personnel*; (c) naval staff; (d) bureau of material. The school for executive officers (there are no marine engineer officers in the navy) is located at Stockholm, the full course is six years. There are two dockyards, one at Stockholm and one at Karlskrona. The fleet consisted in 1915 of 1 small battleship of 6690 tons, nearly completed, and 4 of about 7000 tons which had been laid down; 1 of 4200 tons, 4 of 3600 tons, 4 of 3400 tons, 3 of 3200 tons; 3 monitors of 1500 tons; 7 small monitors of 453 tons, old but recently rebuilt, 1 old monitor of 1550 tons, 1 armored cruiser of 4035 tons; 5 torpedo gunboats of 787 tons, 9 destroyers; 53 torpedo boats; 9 submarines, 4 mine layers; 1 royal yacht; 1 hospital ship, 1 submarine depot vessel, 1 ice breaker; also old cruisers, gunboats, and hulks serving as training vessels, torpedo and gunnery school ships, repair ship, etc. In 1914, before the outbreak of war, the Swedish Parliament approved a naval programme. This provided in 20 years 7 coast-defense vessels, 18 destroyers, 1 mine layer. The war caused 4 coast defenders to be com-

menced at once. They were all building in private establishments in Sweden. The budget for 1915 was \$8,427,345.

Turkey. In 1870 the navy reached the climax of its strength—at least as regards material—and Turkey was distinctly one of the great naval powers. The reduction of revenue and governmental disturbances caused by the Turko-Russian War of 1877-78 caused Turkey to let her navy deteriorate until it was wholly ineffective for purposes of war. After 1878 the government made spasmodic efforts to reorganize the *personnel* and refit or add to the material, but nothing permanent was achieved. In 1902-07 several of the old ships were rebuilt. In 1910 two old 10,000-ton battleships were purchased from Germany and a new one ordered in England. In 1913 a Brazilian battleship under construction was purchased, and in the early part of the Great European War the German battle cruiser *Goeben* and the German light cruiser *Breslau* were sold to Turkey, but retained much of their German *personnel*. At the same time Great Britain seized the two Turkish battleships which were building in England and converted them to her own use. Some destroyers were ordered in France early in 1914, but it is not certain that work was actually begun on them. The navy is presided over by a Minister of Marine appointed by the Sultan. The navy department is divided into four bureaus, viz.: (1) *personnel*; (2) material; (3) construction; (4) medicine and hygiene. The only important dockyard is at Constantinople. This is a large and well-planned establishment, but it has not been kept in order, and much of the machinery and fittings is useless. The *personnel* of the fleet is extremely variable in numbers. In 1910 it consisted of 6 vice admirals and 10 rear admirals with the rank of pasha, 100 captains and 25 commanders of superior grade, 50 commanders of inferior grade, and about 275 lieutenant commanders—all with rank of bey; about 275 lieutenants and 200 sublieutenants with the rank of effendi. The enlisted force varied from 2500 to 20,000, usually about 5000 since the purchase of the German battleships. For many years the larger vessels swung around their buoys in the Golden Horn without men enough on board to move them or to give their guns, hulls, or machinery adequate care. In 1914, at the time Turkey threw in her lot with the German-Austrian alliance, exclusive of the *Goeben* and *Breslau* her navy consisted of the following: 2 battleships of 10,000 tons, 1 old-type battleship (launched 1874, rebuilt 1903) of 9120 tons, 1 coast-defense vessel of 2400 tons (1869, rebuilt 1907), 2 cruisers of 3830 tons, 3 gunboats of about 800 tons, 8 gunboats of 500 tons and many smaller ones, 6 large transports, 10 destroyers, 10 comparatively new torpedo boats and many old ones—few in condition to be used.

United States. The navy is fully described under UNITED STATES, Navy.

Uruguay. The navy of Uruguay consisted in 1915 of the scout cruiser *Uruguay* of 1132 tons, 2 gunboats of 380 tons, 1 of 668 tons, 2 transports of 400 and 260 tons, and a number of small steamers.

Venezuela. The navy of Venezuela consisted in 1915 of a small cruiser of 1125 tons (launched in 1886), a torpedo gunboat of 571 tons (1891), a gunboat of 200 tons (1895), a torpedo boat of 100 tons (1887), an armed

NOTE.—No vessels are included in the foregoing table which are over 20 years old, unless they have been rebuilt within 10 years. The lists for each nation are corrected for all vessels lost, sunk, destroyed, captured, etc., up to July 1, 1915. Vessels which could, on that date, be completed in three months, are entered as built.

yacht of 568 tons (1884), a tug, a small transport of 740 tons, and some small craft.

NAVIGABLE RIVER. See RIVERS, NAVIGABLE.

NAVIGATION (Lat. *navigatio*, a sailing, from *navigare*, to sail, from *navis*, ship + *agere*, to lead) In a broad sense, all means whereby the ship is made to proceed from place to place, but, in a more technical sense, only those means whereby the course of the vessel is directed or ascertained.

HISTORY OF NAVIGATION

The early history of navigation is wrapped in obscurity. The Egyptians had vessels large enough to be called ships about 3000 years B.C. and perhaps long before this. The Chinese also built ships at a very early date. The appliances for navigating these vessels must have been few and rude, and a voyage of a few hundred miles was regarded as a great undertaking. Considering the difficulties under which they labored, the voyages of the Phœnicians must be regarded as daring ventures. They spread their merchant

fleets throughout the Mediterranean, navigated Solomon's squadrons to the Persian Gulf and Indian Ocean, and planted colonies everywhere.

Principal among these colonies was Carthage. The Carthaginian fleets passed the Pillars of Hercules and, with no better guide than the stars, are believed to have sailed northward to the British Isles and southward for some distance along the west coast of Africa. In 611 B.C. a Phœnician expedition fitted out by Pharaoh Necho started to circumnavigate Africa, a feat which is said to have been actually accomplished. From the eighth to the fourth century B.C. the Greek states gradually developed the art of navigation, and at the time of the Peloponnesian War the Athenians appear to have been skillful tacticians, capable of concerted manœuvres. In the fourth century B.C. Alexander the Great destroyed the power of Tyre, transferring its commerce to Alexandria, which became the centre of trade for the ancient world. Rome wrested from Carthage its naval power and diverted its vast trade to the Italian sailors.

During all this period the average size of the vessels had been continually increasing. For propelling war vessels and boats in the coasting trade, oars were chiefly used, though nearly all vessels possessed sails, but for long commercial voyages, sails were necessarily the main reliance, and some knowledge was early possessed of beating to windward against adverse breezes. Speed, however, was not ordinarily attained, as a voyage from the Levant to Italy or Carthage was often the work of a season. During the time of the Roman Empire no great progress seems to have been made except in the size of the vessels, but regular fleets were maintained, both in the Mediterranean and on the Atlantic coast of Gaul, for the protection of commerce.

The barbarian nations of the North developed the art of navigation in their own way. The Saxons, Jutes, Danes, and Norsemen began to roam the ocean in every direction, in small vessels they trusted more to the winds than to oars and, sailing singly, gradually acquired that hardihood and daring which ultimately rendered them masters of the sea. The Danes and Norsemen extended their voyages to Iceland, Greenland, and Newfoundland, while they first ravaged and then colonized the coasts of Britain, France, and Sicily.

In the Middle Ages the Venetians, the Genoese, and the Pisans became the carriers of the Mediterranean Sea. Their merchants traded to the farthest Indies, and their markets became the exchanges for the produce of the world. Their constant rivalries gave occasion for the growth of naval tactics. So rich a commerce tempted piracy, and the Mohammedan corsairs spread over the Mediterranean and, passing through the Straits of Gibraltar, ravaged the Atlantic coast.

The mariner's compass (q.v.) came into quite general use in the thirteenth century and rendered the seaman independent of the sun and stars, so far as simple steering was concerned. The variation of the compass from true north seems to have been observed as early as 1269, but it was not until the voyages of Columbus that much attention was paid to it.

The works of Claudius Ptolemy (q.v.), although forgotten in Europe, were known to the Eastern world and were held in high estimation by the Mohammedan scientists and philosophers. As the Arabs, Saracens, and Moors possessed

charts of much value, it is possible that they were based upon Ptolemy's maps or improved by a knowledge of them. Very early in the Middle Ages, perhaps before 1000 A.D., small books of sailing directions (called portolani or pilots) were compiled, and one or more charts included in them. These charts were covered with lines radiating from important seaports, or from other points on land or in the water, and showed the direction of different points from each other. On board ship the courses were at first ascertained from the sun, moon, and stars, but the introduction of the compass caused the portolani charts to be much improved and further developed. One of the oldest existing charts of this kind is the so-called Pisan chart, which belongs probably to the middle of the thirteenth century, it covers the whole of the Mediterranean. The earliest portolani chart of which the exact date is known appears to be that of Pietro Vesconte (1311). These charts are all plane and are chiefly of the Mediterranean, though some which appeared in the fourteenth century show the Azores, the Canaries, and the coast of Africa as far as Cape Bojador.

The translation and dissemination of Ptolemy's works in the fifteenth century caused a great improvement in maps and charts, and the subsequent labors of Mercator (q.v.) and others brought them to a very satisfactory state, considering the lack of exact geographical information. Mercator's projection was a great advance in navigation, for it enabled a ship's course (by compass) to be laid down as a straight line on the chart. Edward Wright, who published in 1599 a work entitled *Certain Errors in Navigation Detected and Corrected*, gives a complete exposition of the proper method of constructing a Mercator's projection (see MAP), together with other information of value.

In the early days of seagoing, vessels followed the coast in good weather and kept away from it in bad. The only navigating instruments were the sounding pole or a weight at the end of a line (see SOUND, SOUNDING), and the moderate depths which could be measured by these means caused the depth of the sea to be greatly exaggerated in the popular mind. After a time some form of sundial was used for steering courses in the daytime, and the coast was not followed so closely. At night a star, especially the polestar, was used when possible. Deep-sea navigation made a great advance in the fifteenth century through the work and assistance of Prince Henry of Portugal (called the Navigator), whose voyages and investigations were carried on between 1415 and 1460. He improved the existing charts, began the development of navigation as a science, and the encouragement he extended caused the invention of many nautical instruments and the compilation of numerous nautical tables.

Means of measuring the altitude of heavenly bodies are very old, but they were not much used at sea until after voyages beyond the limits of the Mediterranean became common. The first practicable instrument for sea observation was the cross-staff. The date of its invention is unknown. It is described in the first edition (1496) of the *Margarita Philosophica*, but it was then an old instrument of which the use by seamen was beginning to be common. Columbus is said to have used a cross-staff on his first voyage. It was employed for the determination of latitude and, after the preparation of suitable tables, for the determination of longitude by

measuring the distance between a fixed star and the moon. The astrolabe (q.v.), a more cumbersome instrument, was adapted to nautical uses by suspending it from a small ring, and it became widely used by mariners. Diaz, Vasco da Gama, and Columbus are said to have used it. From the cross-staff and astrolabe were developed the forestaff, backstaff, double quadrant, and sextant (q.v.).

In 1530 Gemma Frisius, of Louvain, suggested the use of watches, in conjunction with instrumental observation, for the determination of longitude, but the lack of good timekeepers greatly hampered the method. The importance of improving them was more and more appreciated as time went on, but it was not until 1765 that Harrison was awarded £10,000 by the British government for his improvement (temperature compensation) of the chronometer. This was found to be so satisfactory that a second award of £10,000 was made to him.

According to Pedro Núñez the captains and navigators of Prince Henry the Navigator were well instructed in mathematics, geometry, and the care of instruments. It is therefore probable that the astronomers and scientists employed as instructors by the Prince prepared works upon navigation, but none are known to exist. In 1530 Gemma Frisius wrote upon astronomy, cosmogony, and the use of the globes. In 1537 Pedro Núñez (Nonius), cosmographer to the King of Portugal, published a work which discussed various problems in astronomy, charts, and in certain fields of navigation. But the earliest treatise devoted specially to navigation was that of Pedro de Medina, published at Valladolid in 1545. This was followed in 1556 by *The Art of Navigation* by Martín Cortés, published at Seville. In 1593 John Davis published *The Seaman's Secrets*, in which he described traverse and great-circle sailings. Early in the seventeenth century arithmetical calculation of navigational problems replaced instrumental solution. About 1620 trigonometry was applied to navigation, and this was closely followed by logarithmic tables. During the next hundred years timekeepers were greatly improved, and navigation tables and formulas considerably improved and extended. The invention of the sextant (q.v.) in 1731 and Harrison's chronometer in 1765 gave to observations an approximation to exactitude they had not previously possessed.

Among the developments of the nineteenth century were the Thomson dry compass, the Ritchie liquid compass, the patent log, compensation for deviation of the magnetic compass, the great-circle chart, Sumner's line of position, improvements in charts, navigation and astronomical tables, and in methods of computation, and a vastly improved knowledge of storms, which has taught how to avoid them when possible and to minimize their danger when avoidance is impossible. The great improvement of the twentieth century is the gyroscopic compass. (See COMPASS.) Steam and other forms of power propulsion have added much to the ease and safety of navigation, while the increased number of vessels has detracted something from the safety. The most serious enemies of the navigator of the present day are fogs and irregular currents.

MODERN ART OF NAVIGATION

In the merchant service vessels are in charge of a pilot when going in or out of port. Naval

vessels take pilots only under special circumstances which require the local knowledge of a pilot. Upon getting under way leadsmen are stationed ready to take soundings. The ship is kept in the channel by observing beacons, buoys, landmarks, ranges, lighthouses, etc. If the water is shoal, soundings are taken at regular intervals. For convenience in navigating certain channels at night lighthouses and lighted beacons or buoys are placed in suitable locations. In some channels ranges are established, i.e., two objects (at night two lights) are located on a prolongation of the axis of the channel so that by steering in a manner to keep them in line the ship is kept in deep water.

Upon reaching the open sea the pilot (if one is taken) is discharged. The position of the vessel is then ascertained by compass bearings or other means, and the place so determined is the point of departure. The course is then laid for the next port or for a point on the most available route.

The further navigation of the vessel is effected by means of: (a) compass bearings, or horizontal angles, if proceeding along the coast and the land is in plain sight; (b) observations of the heavenly bodies, (c) dead reckoning, (d) soundings (see SOUND, SOUNDING) so long as the depth is less than 100 fathoms. Dead reckoning is used when land is not in sight and when the sky is so covered with clouds as to make astronomical observations impossible; also to compute the short distances between observations. (See SAILINGS.) To determine the ship's exact position by soundings alone is always difficult and at times impossible, but they usually suffice to keep the vessel out of danger. By taking a large number of soundings and spacing them at the proper intervals on the edge of a slip of paper, a close approximation to the position may be obtained by moving the slip until all soundings on it agree closely with corresponding ones on the chart.

When sailing along a coast, the exact position of the ship may be found by reference to any objects on shore which can be identified and are marked on the chart. If three objects can be seen and the angles between them are over 30° , these are measured, and the position determined by a three-armed protractor or station pointer. If only two are visible, compass bearings of both, if laid down on the chart, determine the position by their intersection; or one bearing and the angle between the two may be taken. With one object, bearings at different times must be taken, and the distance run by log between the times of observation noted. Lines parallel to the course are then drawn across the bearing lines on the chart. The one on which the intercepted distance is correct is that on which the ship has sailed. Its intersections with the bearing lines are the positions of the ship at the times of observation. A very common practice is to note the time and reading of the patent log when an object bears 45° forward of the beam and when abeam. The distance run between the observations is the distance of the ship from the object when it is abeam.

When out of sight of land, positions are determined by observations of heavenly bodies. The sun is more useful, but the moon, planets, and stars are observed when the horizon can be clearly seen. The latitude is most accurately determined when the body is on the meridian (i.e., bears north or south), and the longitude

when it bears east or west. The altitude of a heavenly body above the horizon is measured by means of a sextant. In the case of the sun the observed altitude must be corrected for semidiameter (to get the altitude of the sun's centre), for parallax (to reduce the observation to the centre of the earth), for refraction (to allow for bending of the light ray), and for dip of the horizon (to get the correct angle above a horizontal plane). In the case of a star or planet parallax and semidiameter are inappreciable. See LATITUDE AND LONGITUDE.

Observations for Latitude. The simplest method of obtaining the latitude is by observing the meridian altitude. In Fig 1 $OP'QPM$ is a section of the earth through the plane of the meridian of M , the point of observation; PCP' is the polar axis. OCQ is the plane of the equa-

FIG. 1.

tor; S is the object observed; HH' is the plane of the horizon; $O'M$ is parallel to OCQ , Z is the zenith; AM is parallel to PCP' . Then the angle SMH ($=h$) is the altitude of the body, SMO' ($=d$) is its declination from the equator; $O'MZ$ ($=L=OCM$) is the latitude of M , and $ZMH=90^\circ$; therefore $L=OCM=O'MZ=90^\circ-(h-d)=90^\circ-h+d$.

Therefore, if we add the declination (taken from the table in the *Nautical Almanac*) of the body to 90° and subtract the corrected altitude from the sum, we get the correct latitude. To make sure that the altitude used is the meridian altitude, the observer begins to measure it a little before noon. It increases steadily to a maximum and then decreases. As soon as the decrease begins the maximum is known to be the meridian altitude. If cloudy about noon and there is danger of not getting the meridian altitude, the times of the other altitudes are observed. The one nearest to apparent noon is taken, and this may be corrected from the tables so as to give the proper meridian altitude. If no altitude within 13 minutes of noon can be obtained, a spherical triangle must be solved, the method being somewhat similar to that used in determining longitude.

Observations for Longitude. The longitude of a place is its angular distance from the prime meridian. In most countries Greenwich is taken as the prime meridian for various reasons. Since

NAVIGATION, AERIAL, LAW OF The law governing the use of the air spaces by persons operating balloons and other air craft, and the rights and obligations of such persons with respect to the soil or territory over which they operate. The law of the airship comprehends, therefore, questions of public as well as of private right and rules of municipal or domestic as well as of international law. When aerial navigation was still in its infancy, it had already produced a considerable legal literature.

Sumner's Method. When a heavenly body is in the zenith, its altitude is 90° . At points 10° away in all directions the altitude is 80° . Such points are located on a circle with the zenithal point as a centre. So for any given altitude h of a heavenly body there is a circle on the earth at all points of which the altitude is h . If the equation which has been given for the determination of time (and longitude) is solved with two different values of the latitude (L), it will give two points on the circle corresponding to the observed altitude. Since this circle is large (provided the altitude is not near 90°), if the difference in latitude of the two points is 30 miles or less, a line joining them practically forms part of the circle. When the correct latitude is obtained, the point of this line which has the true latitude is the correct position in both lati-

This was, in the absence of concrete cases, largely abstract and speculative in character, dealing not so much with the actual rights of user of air space and actual liability for injuries sustained as with the principles on which the law of the subject might be expected to develop in the future. Thus, in the field of public law the right of a state to exercise sovereignty in the air space over the national territory was unquestioned, but whether this sovereignty was based on actual ownership of the air space, whether it was unlimited in extent or restricted to a definite or indefinite zone, whether, if restricted, it was limited to a fixed altitude or to the range of a cannon shot, whether it was absolute or subject to an easement of use by foreign aviators—these were questions much debated and as to which no agreement was reached.

The same differences of opinion developed with regard to the rights of owners of the land underlying the air space in private law. It was conceded that such a proprietor owns the air space above his land, but whether, according to the maxim of the Roman and the common law, he owned all the way up, *usque ad cœlum*, or only so far as was necessary to protect him in his use and enjoyment of the surface of his land, was still in dispute. Even in our legal system it was, to say the least, doubtful whether a person flying a kite or operating an aeroplane at a considerable height above my land would be held liable in trespass, though he would certainly be liable as for a nuisance for any injury to my house or trees or garden resulting from his acts. So far as this branch of aerial law was concerned, the following points might be considered settled:

1. The aviator is liable in trespass for landing, whether negligently or by design, on my land.

2. In such a case he is liable not only for the damages directly caused by his trespass, but also for those indirectly resulting therefrom, as through the gathering of a crowd attracted by his descent.

3. He is liable in trespass for sailing close to the ground or to the buildings thereon.

4. He is liable in trespass if he throws anything, such as sandbags, bottles, or other articles, on the land.

5. Apart from any trespass on land he is liable for any injury resulting from his negligence to any one.

6. He is probably liable in England and the United States for any injury caused by him, even though not due to negligence on his part—this because of the danger to the general public which the practice of aviation involves. Several of the European codes have laid down the rule that injury done without fault results in no liability, but the contrary rule was laid down in the draft code prepared by the American Bar Association (1910). This bill (not enacted into law in 1915) also provided for the licensing of air men by the state. No rules having been adopted governing collisions, salvage, etc., in connection with aviation, it was, therefore, a matter of conjecture whether the maritime law or the law governing vehicles on land, which differ on these points, would be applied to air craft. Whether a crime or a tort committed on board an airship was punishable in the state over whose territory the wrong was done or by the state in which the craft was owned was also a question for future determination.

International law has dealt with several aspects of aviation, especially (1) with the status of the aviator scouting or carrying dispatches in time of war, (2) with the discharge of projectiles and explosives from balloons and aeroplanes; and (3) with the question whether the airship of a belligerent may lawfully cross the territory of a neutral power.

As to the first point, it was contended by Bismarck in the Franco-German War in 1870 that balloonists of the enemy who crossed the German lines should be executed as spies. As a matter of fact, however, captured balloonists were treated by the Germans as well as by the French as prisoners of war, and this practice has been adopted as the rule in all cases where the aviator has not acted clandestinely or on false pretenses. (Hague Conference of 1899, Second Convention, Art. 29.)

As to the second point, a determined effort made by several of the Powers, notably by Belgium and Great Britain, wholly to prevent the use of airships as engines of destruction in time of war was defeated by Germany, France, and others of the Great Powers. A convention prohibiting "the discharge of projectiles and explosives from balloons or by other new methods of a similar nature" was adopted by the First Hague Conference (1899) for a term of five years and was renewed by the Second Conference (1907), but as all the great military Powers, with the exception of Great Britain and Austria-Hungary, refused to sign it, it became a dead letter. However, a more restricted proposal of the First Conference forbidding the bombardment of undefended places was adopted by the Second Conference and extended so as to include aerial operations as follows. "The attack or bombardment *by whatever means* of towns, villages, habitations, or buildings which are undefended is prohibited." (Regulations Respecting the Laws and Customs of War on Land, Art 25.) This convention was ratified by all the Powers and was, therefore, in full force during the European War of 1914. As expressed it lent itself to evasion. There was a question as to the meaning of the term "undefended." It might mean a town or other place unfortified in the old sense of the term, or it might mean a place undefended in any way, even by a gun or guns intended only as a defense against hostile air craft, and in either case it left room for doubt whether an undefended private residence or church in a fortified town was covered by the terms of the convention. On any construction, however, the provision was repeatedly violated in the course of the war; wholly undefended towns and places, as well as private dwellings, railroad stations, and the like in cities like Paris and London, which were in the technical sense fortified, have suffered from aerial bombardment.

As to the third point, it seems to be conceded that for a belligerent airship to use the air space of a neutral state for purposes connected with the conduct of a war was a violation of the neutrality of such state. On the other hand there is no basis for the claim that such use of neutral territory for purposes of observation made before the outbreak of hostilities is a violation of neutrality.

NAVIGATION, FREEDOM OF The right which all nations possess of unrestricted passage over the high seas. While the right is now universally admitted, it is only within the past century that the question has become a settled one. Formerly claims of territorial jurisdiction were made over large portions of the ocean, and these claims have led to much controversy and frequent international disputes. But the question of national control in its present phase is reduced to the application of the rule to broad arms or recesses of the sea, narrow seas inclosed within the territory of a single state, straits leading to inland seas, such inland seas and navigable rivers rising in one country and discharging through the territory of another.

Of the first class bays are generally conceded to belong to the states to which the embracing promontories belong, unless the headlands are so far separated as not to permit of effective defense. Thus, Delaware Bay was in 1792 declared to belong exclusively to the United States, and a like claim for Chesapeake Bay would hardly be contested, although the Bay of Fundy is held to be a part of the high seas.

The straits over which international controversy has chiefly arisen are those leading into the Baltic and Black seas. Denmark claimed exclusive control over the former by prescriptive right. As early as 1319 certain prescribed tolls were levied upon the Dutch, an attempt to increase which a century afterward resulted in war. In the seventeenth century England and France contracted to pay the same Sound dues that the Dutch paid. This continued until about 1855, when an arrangement was made whereby Denmark relinquished her claim to tolls and agreed to police properly and protect the passage. Previous to Russia's acquisition of the northern coast of the Black Sea it was Turkish water, but by the Treaty of Adrianople (1829) entrance through the straits into the Black Sea and navigation thereon were permitted to Russia and Powers friendly to her. But according to the ancient custom all foreign vessels of war had been prohibited from entering the Bosphorus and the Dardanelles, and this inhibition was continued under the Treaty of London (1841) between Turkey and the five Powers. By the Treaty of Paris of 1856 the Black Sea was neutralized, but in 1871 Russia secured the abrogation of this provision of the treaty and has the right of maintaining her fleets of whatever size in the Black Sea. Turkey might in time of peace lawfully open the straits to her friends, although unfriendly to Russia, whenever it might seem necessary to provide for her own safety.

When a navigable river runs between two states, both are guaranteed its unmolested use, and the line of jurisdiction is held to run along

the middle of the stream. But when a river rises in the territory of one state and discharges through the territory of another, international law does not admit the moral claim sometimes asserted by the upper state to right of navigation to the mouth. Yet nearly all such streams flowing through the territory of Christian nations have now been opened by international agreement. By the act of the Congress of Vienna (1815) declaring free the use of certain streams separating or traversing the territory of different Powers, the Rhine and Scheldt were opened to navigation. This act also opened most of the other European rivers, excepting the Danube, which by the Treaty of Bucharest and later by that of Adrianople (1829) was made free for common commercial use to Turkey and Russia. Later by the Treaty of Paris (1856) this also came within the application of the concert of the Congress of Vienna. At the close of the Revolutionary War Spain held the territory at the mouth of the Mississippi and refused the United States outlet to the Gulf of Mexico. The Louisiana Territory was subsequently ceded to France, and its purchase by the United States in 1803 disposed of the question. The St. Lawrence was thrown open to the United States by the reciprocity Treaty of 1854 with Great Britain, which also included the reciprocal use of the Upper Lakes and the freedom of Lake Michigan to Canadian subjects. In South America the freedom of the Río de la Plata to commerce was guaranteed by a series of treaties from 1853 to 1859, while the Amazon was in 1867 declared by Brazil to be open to all nations. The Stikine, Yukon, and Porcupine rivers of Alaska, rising in British territory, were opened to the subjects of England and the United States by the Treaty of Washington (1871), while the Congo and Niger in Africa were opened under an agreement for an international commission provided for by the Congo Conference of 1884-85. Consult the authorities referred to under INTERNATIONAL LAW. See also HIGH SEAS, MARE CLAUSUM.

NAVIGATION ACT. The name applied to each of a series of acts, known collectively as the Navigation Acts, passed by the English Parliament, beginning with 1645, for the purpose of protecting the shipping of Great Britain and her colonies, of injuring the shipping of the Dutch, the chief rivals of the English, and of exploiting, for the benefit of England, the commerce of the English colonies. See NAVIGATION LAWS.

NAVIGATION LAWS. The early restriction placed upon commerce was but one phase of the application of the economic doctrines advocated prior to the time of Adam Smith, prohibiting exports, regulating intercourse, and generally obstructing the operation of economic laws. The first recorded British navigation law belongs to the reign of Richard II (1381) and required the shipment of merchandise by the "King's liege people" in "ships of the King's hegance." Subsequently a more liberal policy was pursued. With the discovery of the New World and the consequent growth of colonial dependencies, both the importance of navigator laws as a question of policy and their sphere of influence were greatly extended. England, France, Spain, Portugal, and Holland by their restrictions prohibited all commercial intercourse between their colonies and other nations, and Spain even treated the crews of foreign ships wrecked upon her coasts as pirates. In 1645 the

English Parliament passed an Act prohibiting the importation into England of whale oil and other products of the whale fisheries in any vessels except such as were owned in England and were manned by English seamen. This Act was the first of a long series of Acts which are known collectively in history as the Navigation Acts. The Acts of 1651 and 1660—the latter of which is known officially as the First Navigation Act—served as the basis of the British legislation in this field for almost 200 years. In general, the objects of these Acts, as of the succeeding ones, were to protect the shipping of England and her colonies and to exploit the trade of the colonies in the interest of the mother country. The chief feature of the Acts of 1651 and 1660 was the prohibition of the importation into England of foreign products except in English ships or in the ships of the country of production. In 1663, by what is usually known as the Second Navigation Act, it was ordered that "none of the products of the English plantations or factories . . . in Asia, Africa, or America shall be carried anywhere (except to other plantations) till they be first landed in England, under the forfeiture of ships and cargoes." The English restrictive measures neither destroyed the Dutch commerce of the seventeenth century nor stamped out American shipping interests of the eighteenth. The chief features of the British Navigation Code, which was essentially identical with that of all maritime nations as it existed down to the time of its repeal in 1849, required: That no foreigner could own, wholly or in part, an English ship, the captain and three-fourths of the crew must be British subjects, foreign products must be imported in British ships or in ships of the country of production, products of Asia, Africa, and America could not be imported into Great Britain from any European port in any ship whatsoever, and such products could be imported from any other place only in British ships or those of the country of production. No coastwise trade was permitted in foreign ships to the United Kingdom or between different British possessions, and trade of any kind was permitted only by special authorization. The effort to evade these restrictions involved great waste of capital, while the adoption of a more liberal policy has resulted in a steady enlargement of the prosperity of the British merchant marine.

For the navigation laws of the United States, see MERCHANT MARINE OF THE UNITED STATES.

NAVILLE, nâ'vêl', EDOUARD HENRI (1844–) A SWISS Egyptologist, born at Geneva, June 14, 1844, and educated at Geneva University, King's College, London (1862), Bonn (1866), and the Faculté des Lettres, Paris, receiving his degree in 1867. During this period, having paid much attention to Egyptology, in 1868 he followed the courses of Lepsius at Berlin, in the following year went to Egypt, and in 1870 published as the result of his investigations there *Textes relatifs au mythe d'Horus recueillis dans le temple d'Edfou*. His *La litame du soleil* appeared in 1875 and his *Inscription historique de Pinodjem III* in 1883. Commissioned in 1874 by the London Congress of Orientalists to edit the text of the Egyptian *Book of the Dead* (q.v.), Naville spent the next 10 years collect-

ing material in the libraries and museums of Europe. The results of his labors appeared in *Das ägyptische Tottenbuch der 18. bis 20. Dynastie* (1886), one of the most important works in the history of Egyptology. Beginning in 1882, Naville usually spent his winters in Egypt conducting fruitful investigations for the Egyptian Exploration Fund. In 1891 he became professor of Egyptology in the University of Geneva. Among the most important of his works, besides those already mentioned, are *The Store City of Pithom and the Route of the Exodus*, Egyptian Exploration Fund Memoir, 1 (1885); *Goshen and the Shrine of Sift el Henneh*, ib., iv (1887); *The Festival Hall of Osorkou II*, ib., x (1892); *Ahnas el Medineh*, ib., xi (1894); *Deir el Bahari*, ib., xii–xiv, xvi, xix (1894–1901); *Les ames de la paix dans l'Afrique du Sud* (1901); *La religion des anciens Egyptiens* (1906; Eng. trans., *The Old Egyptian Faith*, 1909); *Papyrus funéraires de la XXle dynastie* (1912).

NAVRÁTIL, nâ'v'rá-têl, CARL (1867–) A Bohemian composer, born at Prague. He studied under Guido Adler and Ondříček. His compositions include two operas, *Hermann and Salammbo*, five symphonic poems, *John Hus*, *Získa*, *Zalov*, *Neklan*, and *Der weisse Berg*; *String Quartet in D Minor*, *Symphony in G Minor*; *Mass in D*, two trios and two quartets for piano and strings, a sonata for violin and piano and one for viola and piano; and much pianoforte music and many songs.

NAVY. See NAVIES.

NAVY, DEPARTMENT OF THE. One of the ten executive departments of the United States government, created by Act of Congress of April 30, 1798, and charged with the general control and administration of the navy. From 1789 to 1798 the management of naval affairs was under the control of the War Department. At the head of the department is a secretary, who is a member of the cabinet, appointed by the President with the advice and consent of the Senate, and receives an annual salary of \$12,000. As the President is by the Constitution the commander in chief of the navy, the Secretary is generally subject to his direction. It is his duty to execute such orders as the President may give relative to the administration of naval affairs, including the procurement of naval supplies and the construction, armament, equipment, and employment of vessels of war. A variety of specific duties are imposed upon him by law, in which cases he is not subject to the direction of the President. He makes an annual report to the President of the operations of the Navy Department. His deputy is the Assistant Secretary, who is appointed by the President, and who during the absence or incapacitation of the Secretary acts in his stead, taking the title of acting Secretary. An Act of June 8, 1880, authorized the appointment of a judge-advocate-general of the navy from the marine corps or the navy with the rank of colonel or captain. It is his duty to receive, revise, and record the proceedings of courts-martial, courts of inquiry, boards for the examination of officers for retirement and promotion in the naval service, and to give opinions on such legal questions as arise in the course of the administration of the navy. Another officer of importance attached to the Navy Department is the commandant of the marine corps.

By an Act of July 5, 1862, eight bureaus were established in the Navy Department, at

the head of each being a chief, appointed by the President from among the officers of the navy. These are the bureaus of (1) Yards and Docks; (2) Equipment; (3) Navigation; (4) Ordnance; (5) Construction and Repair; (6) Steam Engineering; (7) Medicine and Surgery; and (8) Supplies and Accounts. See *Navy*, under UNITED STATES.

NAVY LEAGUE OF THE UNITED STATES. An organization incorporated in 1903 whose object is "to acquire and spread before the citizens of the United States through branch organizations and otherwise information as to the condition of the naval affairs and equipment and to awaken public interest and cooperation in all matters tending to aid, improve, and develop their efficiency." The league is strictly nonpartisan, and men, women, and children are eligible to membership. Its badge is a button of silver gilt and blue enamel, with letters in white and an anchor of gold. The membership in 1915 was about 10,000. The president in that year was Gen. Horace Porter. The league's headquarters are in Washington.

NAVY REGISTER. An annual official publication of the United States Navy Department. It gives a list of the officers of the navy and maine corps in order of their rank, a list of retired officers, a statement of resignations, retirements, dismissals, and deaths since the publication of the previous register, the number of stations with the ships on each and the names of officers attached to them, and an enumeration of the ships of the navy, with some details of their character, present condition, and service. Similar lists are issued for other navies. As a rule they contain less information than the United States register. The British navy list is issued monthly.

NAVY YARD. A navy yard is a government establishment for the construction, repair, and equipment of vessels of the navy. The yards at New York, Norfolk, and San Francisco are equipped for the building of large vessels, and the one at Philadelphia in 1915 was being fitted for such work. One of the most important features of a navy yard are the dry docks, because steel vessels must have their bottoms scraped and painted every six months—not for preservation, but in order to keep up their speed and avoid the useless waste of coal entailed by a foul bottom covered with barnacles and seaweed. The commanding officer of a navy yard is called the commandant and is a naval officer of high rank. The manufacturing and repair department is under control of the manager (an officer of the rank of commander or captain). It consists of the hull division and the machinery division, each with its own head. The other departments of the yard are the general storekeeper's department, yards and docks department, accounting department, pay department, and medical department. The general storekeeper purchases and supplies all the material for yard use and for vessels at the yard, including provisions and clothing for the crews. The head of the yards and docks department is responsible for the care of buildings, wharves, streets, and other public works in the yard. The character of the work in the other departments is indicated by their titles. The principal navy yard of the United States is located at Brooklyn, N. Y., on the East River. There are four dry docks at this yard. Here also is located the naval-clothing factory which

makes the uniforms for the enlisted men. The other important navy yards of the United States are at Norfolk (Va.), League Island (near Philadelphia), Boston, Mare Island (San Francisco Bay), and Bremerton (Puget Sound); there are less important yards at Portsmouth (N. H.), Pensacola (Fla.), and New Orleans, and a yard of considerable importance is being developed at Charleston, S. C. In England the term "dockyard" (see DOCKYARDS, ROYAL) is equivalent to the American designation "navy yard." The great naval establishments on the continent of Europe are generally termed "arsenals." See ARSENAL.

NAWA, na'wá, or **NABA**. A seaport on the west coast of the island of Okinawa, in the Luchu group, Japan (Map. Japan, G 7). It is the principal seaport of the group and exports sugar, cotton, and silk to Japan. Pop., 1903, 43,132. 1908, 47,562.

NAWANAGAR, na-wá'nū'gar. A seaport of India. See NOWANAGAR.

NAX'OS (Lat., from Gk. Νάξος). The largest, most beautiful, and most fertile of the Cyclades (q.v.), known in ancient times also as Dia or Strongyle (Map. Greece, G 6). It lies in the Ægean, midway between the coasts of Greece and Asia Minor. Extreme length, about 20 miles; breadth, 15 miles; area, 163 square miles. Pop., 1909, according to Baedeker, 18,603. The principal products and articles of export are wine, corn, oil, cotton, fruits, and emery. The wine of Naxos (the best variety of which is still called in the islands of the Ægean Bacchus wine) was famous in ancient as it is in modern times, and on this account the island was celebrated in the legends of Dionysus and Ariadne. The island also contains good quarries of marble of a rather coarser grain than that of Paros. They were worked in the sixth century B.C., as is proved by the unfinished statues found in them, among which is a famous colossus some 34 feet in length. The most flourishing period in the history of the island seems to have been in the sixth century B.C. under the rule of the tyrant Lygdamis. In 490 B.C. it was ravaged by Persians and later joined the Delian League, from which (469 B.C.) it was the first to revolt. The island now became a dependency of Athens. After the conquest of Constantinople by the Latins, it became in 1207 the seat of a dukedom, founded by the Venetians, and in 1579 was seized by the Turks. It now forms a portion of the Kingdom of Greece (q.v.). Naxos, the capital, with a population of 1760 in 1909, is situated on the northwest coast, contains Greek and Catholic churches and a castle built by the Venetians, and is the seat of a Greek and a Latin bishop. Consult: Ludwig Ross, *Reisen auf den Inseln des ægaischen Meeres*, vol. i (Halle, 1840); E. Curtius, *Naxos* (Berlin, 1846); Ernest Dugit, *De Insula Naxo* (Paris, 1867); H. F. Tozer, *Islands of the Ægean* (Oxford, 1890); K. Baedeker, *Greece* (4th Eng. ed., Leipzig, 1909).

NAYARS. See NAIRS.

NAYLER, JAMES (c.1617-60). An English Quaker. He was born at Ardsley in Yorkshire. In 1642 he became an adherent of the Parliament and served for about eight years under Fairfax and Lambert. While in the army he began to preach as an independent, but in 1651 was led by George Fox to become a Quaker, and for three years was Fox's literary coadjutor. But popularity turned his head. His followers

fancied that he resembled the pictures of Christ, and they called him Jesus and the Lamb of God, in spite of the protest of Fox and the leading Quakers. After riding into Bristol accompanied by a few followers, in imitation of Christ's entry into Jerusalem, he was arrested on charges of blasphemy, tried before Parliament, and sentenced to the pillory, whipping, branding, and imprisonment for two years. The whole punishment was inflicted. He was released in 1659, recanted his errors, and was again received by the Society of Quakers. A collection of his writings was published in London in 1710, and his *Memoirs* in 1719 and reprinted in 1800. He is mentioned in George Fox's *Journals*. Consult also Sewel, *History of the Quakers* (1725, often reprinted; New York, 1844).

NAZARÆANS, nāz'ā-rē'anz, **NAZORÆANS**, or **NAZARENES**, nāz'ā-rēnz'. A designation of Christians as Galileans. In the Talmud Jesus is called *ha-nazri* and his followers *ha-nazrim*, probably as natives of that part of Galilee which was particularly famous for its luxuriant vegetation, the Galilean lowland is called Genesar or Genosar, the district immediately west of the lake Genesar, or the Galilean garden. The name continued to attach itself to Jewish Christians in general or a particular sect among them (See EBIONITES.) Epiphanius refers to Nazoræans as a Jewish Christian sect living in Berea, about Cœle-Syria, and in Decapolis about the regions of Pella, and in Basanitis, who were formerly called Jessæans. Jerome speaks of Nazaræans in Beica, referred to by the Jews as Minim, whose Gospel of Matthew, written in the Hebrew dialect (i.e., Aramaic), he had copied. The rejection of the virgin birth and the conception of Jesus as a man seem to have been characteristic of the whole sect, or at least a considerable part of it. The Nazaræans should not be confused with the Nasaræans (q.v.). Consult Hoenicke, *Das Judenthum in der ersten und zweiten Jahrhunderte* (Berlin, 1908), and Schmidtke, *Neue Untersuchungen zu den judenchristlichen Evangelien* (ib., 1913).

NAZARENE, nāz'ā-rēn' (Gk. Ναζαρενός, *Nazarēnos*, from Ναζαρά, *Nazara*, Nazareth, Ναζωραῖος, *Nazōraios*, from Aram. nāzārā, branch, shoot). A descriptive term applied in the Gospels and Acts—as it is regularly applied in the Talmud—to Jesus and his disciples. The form *Nazarēnos* occurs in Mark i. 24, x. 47, xiv. 67, xvi. 6, Luke iv. 34, xxiv. 19, the form *Nazōraios*, in Matt. ii. 23, xxvi. 71; Luke xviii. 37, John xviii. 5, 7, xix. 19, Acts i. 22, iii. 6, iv. 10, vi. 14, xvii. 8, xxiv. 5, xxvi. 9. Occurring as it does in the earliest Gospel (Mark) and in the indubitably primary narrative of the visit to Nazareth (Luke iv.) as well as in the obviously primary incident of the walk to Emmaus (Luke xxiv.), it is clear that *Nazarēnos* is the earlier of the two forms, and was used to designate Jesus as coming from and belonging to Nazareth, as is stated in Matt. xxi. 11 (cf. Acts x. 38; John i. 45). As Nazareth popularly (cf. John i. 46) and Galilee by the religious leaders (cf. John vii. 41, 52) were not held in repute, the term *Nazarēnos* came easily to have a contemptuous meaning when used by those not of Jesus' following (cf. Mark xvi. 67). To offset this, it is quite likely that the early Christians substituted for it the later form, *Nazōraios*, as a distinctively Messianic term,

based on the prophecy of Isa. xi. 1, as is evidenced by the specific reference in Matt. ii. 23. This later form came to be the name by which the Christian communities were known within Palestine and by Jews, as Christians was the name given to the disciples in Gentile lands (cf. Acts xi. 26). There was a Jewish-Christian sect of Nazarenes, as we are informed by Jerome and Epiphanius. Very little authentic information about them is obtainable, though they were apparently distinguished from the Ebionites (q.v.), as more loyal to Jesus' teachings. The gospel known as the Gospel of the Nazarenes was in all probability identical with the Gospel of the Hebrews, and was an apocryphal working over of our first canonical gospel.

NAZARENES, or **NAZ'ARITES**. A group of German painters. See PRE-RAPHAELITES.

NAZ'ARETH (Gk. Ναζαρέθ, *Nazareth*, which in all but two passages, Matt. xxi. 11; Acts x. 38, is the less-authenticated text. In place of this the better reading is Ναζαρέτ, *Nazaret*. In Matt. iv. 13 and Luke iv. 16 the best-attested text is Ναζαρά, *Nazara*, to which are doubtless due in other passages the unaccepted variants *Ναζαρέθ*, *Nazareth*, and *Ναζαρά*, *Nazarat*. From an Aramaic word of uncertain form and meaning). A town of Galilee, the modern En Nāsira, famed as the place where Jesus passed the obscure years of his childhood (Map. Palestine, C. 2). From the question of Nathanael (John i. 46) it may be inferred that it was of no special importance, and possibly was of poor repute. (Consult Conder, *Tent Work*, p. 74.) It lay on the southern slope of the Jebel el Sikh, probably somewhat higher up than the modern town, as is evident from the position of the old cisterns and tombs. From the summit of the hill (some 1600 feet above sea level) one of the finest views in Palestine is obtained, commanding the great plain of Esdraelon, from the Jordan valley on the east to the Mediterranean on the west, and southward to the hills of ancient Samaria, while northward is seen the beautiful plain of El Battōf, beyond which rise the snowy heights of Mount Hermon. With this advantaged site, the town stood apart from the main highways of travel, though within easy reach of them. This seclusion may, to a large extent, account for the fact that there is no mention of the place in the Old Testament or by Josephus. At the same time, it never could have been a very large town, as it had but one spring. At all events, we have no knowledge of its early history. The New Testament writings and the Talmud show that Jesus was popularly called, doubtless in contempt by those not in his following, the Nazarene, and his disciples Nazarenes (cf. Mark xvi. 67; Acts xxiv. 5). (See NAZARENE.) No further mention of the place is found until Eusebius, who says in his *Onomasticon* that it was 15 Roman miles eastward from Legeon (the ancient Megiddo), and not far from Mount Tabor. Epiphanius, a century later, says that it had become in his day a mere village. The Christians of the first three centuries appear to have regarded it with no consideration. In later centuries it began to attract pilgrims, and in 600 it had a large basilica. It naturally was revered by the Crusaders, who greatly embellished the place and transferred to it the bishopric of Scythopolis. In 1229 it was rebuilt by Frederick II. After the conquest of Palestine by the

Turks in 1517, the Christians were compelled to leave the place. About 1620 the Franciscans established themselves in Nazareth, and the great church and convent of the Annunciation was built. This has become one of the most popular pilgrim shrines in Palestine. The house in which Mary lived is said to have been miraculously transported to Loreto (q.v.), Italy. Of late years Nazareth has materially increased in population, at present containing over 11,000 souls, 4000 Moslems, 4000 Orthodox Greeks, 1000 United Greeks, 1500 Catholics, 200 Maronites, and 250 Protestants. No Jews reside in the town. Of all the traditional sites, perhaps the only reliable one is that of the Virgin's Spring, which must often have been visited by Mary and Jesus, as it is the only spring in the place. The Cliff of Precipitation is more probably the one indicated in Sanday's *Sacred Sites* (p. 59, plate xxiii B).

NAZARETH. A borough in Northampton Co., Pa., 7 miles northwest of Easton, on the Lehigh and New England and the Delaware, Lackawanna, and Western railroads (Map: Pennsylvania, L 5). It contains the Nazareth Hall Military Academy and several places of historic interest, notably the Whitefield House and an Indian monument, both 175 years old, Gray Cottage, and Greenwood and Indian cemeteries. The borough has also a fire engine imported from England in 1791 and believed to be the oldest in the United States. Among the industrial plants are Portland cement works and manufactories of children's waists, hosiery, and musical instruments. Pop., 1900, 2304, 1910, 3878.

NAZARITE (Heb. *nāzîr*, from *nāzar*, to consecrate). Among the Hebrews, one who had devoted himself in a peculiar sense to Yahweh. The term is used of two classes. (a) Nazarites for life and (b) Nazarites for a limited period. The law in Num. vi refers to the latter class alone. According to this law one who had taken the vow of Nazariteship was to abstain from wine or any intoxicating drink, not to suffer a razor to touch his head, but to let the locks of his hair grow long, and to avoid all ceremonial defilement. It is evident from these regulations—particularly the first two—that the Nazarite was to lead a life marked by the return to the simpler and rougher fashions of primitive times. The original purpose of such vows among the Hebrews, as among the Arabs, where they are also found (cf. Wellhausen, *Reste arabischen Heidenthums*, p. 143, Berlin, 1897; W. R. Smith, *Religion of the Semites*, pp. 482 et seq., London, 1894), was for war or revenge, but it was natural also to extend the customs involved to sacred seasons of the year when the deity was to be approached. So among the Arabs to this day, during the days spent by the pilgrims in Mecca (see HAJJ), it

is forbidden to cut the hair, and other restrictions are imposed, most of which emphasize the return in the holy season to more primitive fashions. As for the Nazarite for life, we have only two instances in the Old Testament, Samson and Samuel. The former, in so far as he embodies popular elements, represents the hero of a rude age. It is not said of him that he was to abstain from wine, and, as a matter of fact, he frequently was involved in acts (such as contact with the carcass of a lion) which brought in their wake ceremonial defilement. The long hair in his case may have originally been the natural condition, just as the hero Enkidu among the Babylonians is described as hairy. In the case of Samuel the Nazariteship involves, likewise, merely the obligation to let the hair grow, and this may have been customary among the guardians of the sanctuaries, who were in a perpetual state of sanctity. The application, therefore, of the term Nazarite to Samson and Samuel in the postexilic sense of the word is due to the projection into the past of a condition which reached its development centuries after the age of these two personages. Nazariteship in time lost its old significance and became a species of private asceticism. In this sense John the Baptist is a permanent Nazarite (Luke i. 15) and Paul possibly (though not certainly) a temporary one (Acts xvi 17-26).

Dillmann, *Die Bücher Numeri, Deuteronomium und Josua* (Leipzig, 1886); Rudolf Smend, *Schriftbuch der alttestamentlichen Religionsgeschichte* (Freiburg, 1893); Wilhelm Nowack, *Hebraische Archäologie* (ib., 1894); S. R. Driver, "The Books of Joel and Amos," in the *Cambridge Bible for Schools and Colleges* (Cambridge, 1897); Friedrich Schwally, *Der heilige Krieg in Israel* (Leipzig, 1900); G. B. Gray, "The Nazirite," in *Journal of Theological Studies* (Cambridge, 1900); J. Benzinger, *Hebraische Archäologie* (2d ed., Tübingen, 1907).

NAZARITES (from Lat. *Nazarita*, from Gk. *Ναζαρίτης*, *Nazarîtes*, from Heb. *nāzar*, to separate one's self). A Christian sect found in Hungary and particularly numerous in the Magyar districts of eastern Hungary. They believe in the Trinity, but reject transubstantiation and infant baptism. They have no priesthood, refuse to take oaths or to perform military service, and profess to go to the New Testament for their principles of life. They are said to number about 80,000.

NAZARITES. See PRE-RAPHAELITES.

NAZIANZUS, SAINT GREGORY OF. See GREGORY OF NAZIANZUS, SAINT.

NAZIMOVA, ná-zě'mô-vá, ALLA (1879-). An actress, born in Russia and educated in Switzerland. She received her early training for the stage at a dramatic school in Moscow. After playing in various provincial companies she appeared as leading lady at St. Petersburg in 1904. She visited London and New York in 1905 in Paul Orlov's company, playing in Russian. Having entered into a contract to play in English, she made her English-speaking debut in New York in 1906 after only five months' study. She is best known for her work in Ibsen. Her interpretations of Hedda Tesman in *Hedda Gabler*, Nora in *The Doll's House*, and Rita Allmers in *Little Eyolf* placed her at once in the front rank of modern actresses. She was less successful in her attempts to impersonate English and American character. Perhaps the

most notable of her later performances was in 1912, when she played Mrs. Chepstow in *Bella Donna*. In 1915 she appeared for the first time in vaudeville, in a one-act play called *War Brides*.

NAZIRITE. The same as NAZARITE (q.v.).

NAZORÆANS. See NAZARÆANS.

NEÆ'RA (Lat., from Gk. *Nēapa*, *Nearra*). The name of several nymphs in Grecian mythology and of a maiden mentioned in the poems of Iliace, Vergil, and Tibullus. It is used also in Milton's *Lycidas* to designate an imaginary charmer.

NEAGH, nā, *Ir. pron.* nā'āg, LOUGH. The largest lake of the British Isles, in the north-eastern part of Ireland, 13 miles west of Belfast (Map. Ireland, E 2). It is rectangular in shape, 17 miles long by 10 miles wide, and has a mean depth of 40 feet. It is drained northward into the Atlantic Ocean through the Bann River. Canals connect it with Belfast on the east and Lough Erne on the southwest. It abounds in fish, especially trout, char, and freshwater herring.

NEAGLE, nā'g'l, JOHN (1799-1865). An American portrait painter. He was born in Boston, but his parents moved to Philadelphia soon after his birth. Early apprenticed to a coach painter, he also received some instruction from Bass Otis, but was practically self-taught. About 1818 he began painting portraits in Lexington, Ky., New Orleans, and other cities. On his return to Philadelphia he married the daughter of Thomas Sully, the painter, from whom he received instruction and encouragement. He made rapid progress and, rising in public favor, was made director of the Pennsylvania Academy (1830-31) and first president of the Artists' Fund Society of Philadelphia (1835-44). Neagle was a good draftsman, a fair colorist, and attained striking effects of light and shade. He was clever in delineation of character but lacked sincerity and a true feeling for beauty and grace. Most of his important works are in Philadelphia. These include a full-length portrait of Patrick Lyon at the Forge (1829, Pennsylvania Academy), an enlarged replica of the study in the Boston Museum, which first gained him a reputation (1826). The portraits of Clayton and Cornelia Earl are also in the Pennsylvania Academy. Other well-known portraits in Philadelphia are those of Rev. Dr. Joseph Tiltmore, St. George's Hall; Henry Clay, Union League Club; Dr. Thomas Parke, City Library, and George Washington, Independence Hall. Neagle's portrait of Gilbert Stuart in the Athenæum, Boston, painted during a visit to that city, is considered the best existing likeness of Stuart.

NEAL, DANIEL (1678-1743). The historian of the Puritans, born in London. He entered Oxford, but left, before completing the course, to study for the dissenting ministry in England and Holland. In 1703 he returned to England, in 1706 became pastor of an independent congregation in Aldersgate Street, London, and remained at its head to the end of his life. His first work, a *History of New England* (1720), won for him the honorary degree of master of arts from Harvard in 1721. Neal's greatest work, however, was the *History of the Puritans* from the Reformation to 1689, originally undertaken by him in conjunction with Dr. John Evans. Dr. Evans died in 1730, and Neal completed the work himself (4 vols., 1732-38). It

was, on the whole, very favorably received by the Puritans, but Neal's studied misrepresentation and suppression of facts evoked criticism. Nevertheless the history is for the most part a scholarly piece of work.

NEAL, DAVID DALHOFF (1838-). An American historical and portrait painter. He was born at Lowell, Mass., and after removal in youth to San Francisco was employed in making drawings on wood. In 1862 he went to Munich, where he studied under his father-in-law, the Chevalier Maximilian Annmüller, and at the Academy under Wagner. From 1869 to 1876 he was a pupil of Piloty. After 1879 he principally practiced portrait painting. In his technique and ideals he belongs to the Munich school and has little that is distinctively American. Among the works in his early style are the "Chapel of the Kings, Westminster", "Saint Mark's"; and the "Return from the Chase." His first figure composition, "James Watt," was exhibited at the Royal Academy, London (1873). The "First Meeting of Mary Stuart and Rizzio" (1875) received the great medal from the Royal Bavarian Academy. His most noted work, "Oliver Cromwell and John Milton," is now in the Public Library, Cleveland, Ohio. His portraits owe their success to their clever characterization. Good examples are those of Rev. Mark Hopkins for Williams College, D. O. Mills; Whitelaw Reid, and Teackle Wallis (Athenæum Club, Baltimore).

NEAL, JOHN (1793-1876). An American novelist and journalist of English-Quaker descent, born in Portland, Me. Neal was self-educated and studied law at Baltimore, supporting himself by literary work with an energy that characterized him throughout his long and varied life. Between 1817 and 1819 he published *Keep Cool*, a novel in two volumes, two volumes of verse, and a five-act tragedy, *Otho Meantime* he was admitted to the Maryland bar. In 1823 he paid a visit to England. Here he was a pioneer of American letters, attracting and compelling attention, the first American to contribute to the great quarterlies and to *Blackwood*, and becoming secretary of Jeremy Bentham. Returning to America in 1827, he took up the practice of law in Portland and in 1828 began to edit the *Yankee*, contributing much to various other magazines and newspapers, earnestly opposing capital punishment, and being an early advocate of woman's suffrage. He established a gymnasium, said to have been the first in the United States, and he was himself athletic and a sympathetic teacher and adviser of young men, notable among whom was E. A. Poe. While engaged energetically in journalism, he poured out a steady stream of novels, interspersed with other works. The more noteworthy of his chaotic, Byronic novels are *Randolph* (1823) and *Logan* (1823). *Rachel Dyer* (1828) and *The Down Easters* (1833) are soberer, but not memorable productions. The interesting autobiography, *Wandering Recollections of a Somewhat Busy Life* (1869), was practically the last of his voluminous writings, all of which are characterized by haste, but not less by an ebullient talent and a distinctive flavor of nationality.

NEALE, nēl, EDWARD VANSITTART (1810-92). An English Christian Socialist, born at Bath and educated at Oriel College, Oxford. He became an advocate of social reform and joined the group of Christian Socialists under Frederic

Denison Maurice (q.v.) Neale founded the first coöperative stores in London. In order that the coöperative principle might take firm root and grow, he was especially anxious that associations of producers should be formed to supplement the work of associations of consumers; and he held that the former could only be established by engaging in the wholesale trade. He contended also that coöperators engaged in wholesale production should share profits with their factory operatives. He assisted in forming several industrial societies, was a founder of the North of England Coöperative Wholesale Society in 1863, of the Cobden Mills in 1866, and of the Agricultural and Horticultural Association in 1867, and general secretary to the Central Coöperative Board from 1875 until 1891. He visited America in 1875 and published the results of his observations in the *Coöperative News*. He was a director of the Coöperative Insurance Company and of the Coöperative Newspaper Society, and a Vansittart Neale scholarship at Oriel College for the sons of coöperatives was founded in his honor in 1890. He had an important influence in procuring coöperative legislation, especially the Consolidation Act of 1862 and the Industrial and Provident Societies Act of 1876. Neale was also a thoughtful student of biblical and religious questions. His writings include *The Characteristic Features of Some of the Principal Systems of Socialism* (1851); *The Analogy of Thought and Nature Investigated* (1863); *The Mythical Element in Christianity* (1873); *A Manual for Coöperators* (1881), in collaboration with Thomas Hughes (q.v.).

NEALE, JOHN MASON (1818-66). An English author and hymnologist, born in London. He graduated at Trinity College, Cambridge, in 1840 and in 1842 was ordained priest in the Church of England. While chaplain and tutor at Downing College, he came under the influence of the Oxford movement (q.v.), warmly embraced High Church views, and adhered to his principles in spite of severe criticism. By reason of poor health and also on account of opposition to his religious views he failed to receive fitting advancement in the church and was for many years obliged to content himself with the wardenship of Sackville College, East Grinstead, a charitable foundation. While there he became the founder of an Anglican sisterhood of St. Margaret. His extensive writings on theological and ecclesiastical subjects include *A History of the So-Called Jansenist Church in Holland* (1858) and *Medieval Preachers* (1857). He translated the several parts of Bernard of Cluny's *De Contemptu Mundi*, "Jerusalem the Golden," and in 1863 published *Hymns of the Eastern Church*. He also published, in addition to various collections of hymns: *History of the Jews* (1841); *An Introduction to the History of the Holy Eastern Church* (1850); *Stories for Children from Church History* (1850); *Theodore Phranza, or the Fall of Constantinople* (1857); *History of the Council of Florence* (1861); *Essays on Liturgiology and Church History* (1863).

NEANDER, nā-in'dēr, JOHANN AUGUST WILHELM (1789-1850). One of the most famous of ecclesiastical historians. He was born at Göttingen, Jan. 17, 1789, of Jewish parentage and received his early education at the Johanneum in Hamburg. On Feb. 15, 1806, he publicly renounced Judaism and was baptized in St. Catharine's Church, Hamburg, changing his name

from David Mendel to Neander (from Gk. *νέος*, new + *άνθρωπος*, man, in allusion to the religious change which he had experienced) and taking his Christian names from several of his friends. He now proceeded to Halle, where he studied theology under Schleiermacher and concluded his academic course at his native town of Göttingen. In 1811 he took up his residence at Heidelberg University as a privatdozent, and in 1812 he was appointed extraordinary professor of theology, and in the following year was called to the newly established University of Berlin as professor of Church history. Here he labored till his death, July 14, 1850. Neander enjoyed great celebrity as a lecturer. Students flocked to him, not only from all parts of Germany, but from the most distant Protestant countries. His works, in the order of time, are: *Ueber den Kaiser Julianus und sein Zeitalter* (1812); *Die heilige Bernhard, und sein Zeitalter* (1813); *Genetische Entwicklung der vornehmsten gnostischen Systeme* (1818); *Der heilige Johannes Chrysostomus und die Kirche, besonders die Orients, in dessen Zeitalter* (1821-22); *Denkwürdigkeiten aus der Geschichte des Christenthums und des christlichen Lebens* (1822-24); *Antignosticus, Geist des Tertullianus und Einleitung in dessen Schriften* (1826); *Allgemeine Geschichte der christlichen Religion und Kirche* (1825-52); *Kleine Gelegenheitsschriften* (1824); *Geschichte der Pflanzung und Leitung der christlichen Kirche durch die Apostel* (1832-33); *Das Leben Jesu Christi in seinem geschichtlichen Zusammenhange*, written as a reply to Strauss's work (1837); *Wissenschaftliche Abhandlungen*, published by Jacobi (1851); *Geschichte der christlichen Dogmen*, also published by Jacobi (1856), and several other posthumous works. The majority of these works have been translated into English, viz. *General History of the Christian Religion and Church* (trans. by Joseph Torrey, 12th ed., 5 vols., Boston, 1882); *History of the Planting and Training of the Christian Church by the Apostles* (trans. by Ryland, 1842); *Memorials of Christian Life in the Early and Middle Ages* (trans. by Ryland, 1832); *Life and Times of Saint Bernard* (trans. by Miss Matilde Wrench, 1843); *Life of Chrysostom* (trans. by Stapleton, 1845); *Life of Jesus Christ* (trans. by McClintock and Blumenthal, 1848); *Lectures on the History of Christian Dogmas* (trans. by Ryland, 1858); *The Emperor Julian* (trans. by Coe, 1850), and his commentaries on Philippian James, and First John.

Schulze, *August Neander* (Leipzig, 1890); A. Wiegand, *August Neander's Leben* (Erfurt, 1890), containing bibliography; K. T. Schneider, *August Neander* (Schleswig, 1895); also Adolf Harnack, *Reich auf August Neander* (Berlin, 1889).

NEANDERTHAL (nā-in'dēr-tāl') **MAN**. See MAN, SCIENCE OF, *Ancient Types*.

NEAPOLIS (Lat., from Gk. *Νεάπολις*, new town). The Neapolis mentioned in the New Testament was an ancient town, the seaport of Philippi in Macedonia. The modern town of Kavalla (Map Balkan Peninsula, E 4), with about 5000 inhabitants, is on or near its site. Paul landed here when he sailed from Troas to begin his missionary labors in Europe (Acts xvi. 9-11). The town lay on a bay, affording

excellent anchorage, nearly opposite the island of Thasos, and about 9 miles from Philipp.

NEAP'OLIS. The ancient name of Naples (q.v.).

NEAPOLITAN FEVER. See MALTA FEVER.

NEAP TIDES. See TIDES.

NEARCHUS, nè-ar'kūs (Lat., from Gk. *Néapxos*, *Nearchos*). The commander of the fleet of Alexander the Great in his Indian expedition (327-326 B.C.). He was the son of Androtimus and was born in Crete, but settled in Amphipolis in Macedonia, near the Thracian boundary. He was high in favor with Philip, but was banished on account of his adherence to Alexander. When, however, Alexander succeeded to the throne of Macedon, Nearchus was recalled, and when the conquest of the Persian Empire was begun, he was appointed governor of Lycia and other districts in the south of Asia Minor. In 329 B.C. he accompanied Alexander to Bactria, with a body of Greek mercenaries. When his patron ordered a fleet to be built on the Hydaspes, Nearchus received the command of it. He sailed down the Indus and then to the Persian Gulf and arrived at Susa in Persia, Feb. 24, 324 B.C., shortly after Alexander himself, who had marched overland. After the death of Alexander in 323 B.C. Nearchus accepted the decision of the other generals with regard to the position of the Kingdom and retained his own provinces under Antigonos, whom he accompanied against Eumenes. In 314 B.C. Antigonos appointed him a counselor of his son, Demetrius. Fragments of his narrative of his voyage have been preserved in the *Indica* of Arrian, of which the text was edited by Muller (Paris, 1846). Consult J. W. McCrindle, *Invasion of India by Alexander the Great* (new ed., London, 1896).

NEARCTIC REGION (from Gk. *néos*, *neos*, new + *árrktikós*, *arktikos*, arctic, northern). A region in zoogeography including the entire continent of North America, except the hot coast lands of Mexico. It is a part of Arctogea, or the Holarctic region, in the view of those who regard the Northern Hemisphere as a unit in zoogeography, but in the scheme of Sclater and Wallace it is one of the six primary regions, coördinate with the Palaearctic province. (See DISTRIBUTION OF ANIMALS, *Zoogeographical Map*.) Of further interest here are the subdivisions or local faunal areas that have been distinguished. The earliest attempt at this set apart three regions: an Eastern, from the Atlantic to the plains; a Central, including the dry interior plains, and a Western, the Pacific slope. As early as 1854 Louis Agassiz stated that the eastern half of the continent contained three faunas: a northern, which he called Canadian, a middle (Great Lakes to the latitude of Kentucky), which he called Alleghanian, and a southern or Louisianian. Later writers, especially Allen, dealing mainly with birds, made eight zones in succession from north to south: Arctic, Hudsonian, Canadian, Alleghanian, Carolinian, Louisianian, Floridian, and Antillean. Ornithologists still use this classification east of the Mississippi River. Subsequently Merriam announced the opinion that there was no reason for recognizing a Central province, and that too much stress had been laid upon the dissimilarities between Eastern and Western animals. He asserted the view that only two primary subdivisions of the Nearctic region

should be made: a Boreal province and a Sonoran province. The former stretches from New England and the Great Lakes northwest across Canada to Alaska and sends down long arms along the heights of the Alleghanies and the Rocky Mountains and along the Pacific coast, whose fauna is a mingled one. Everything south of this is Sonoran, embracing nearly all the United States, a great area of the plains of northwestern Canada, and all of Mexico except the low tropical coast lands. These generalizations, however, have not been universally accepted, most critics objecting that too high rank has been accorded to the Sonoran region, whose boundaries are regarded as too indefinite to entitle it to be differentiated and outlined as Merriam proposed in his "Biological Survey of the San Francisco Mountain Region," in *North American Fauna*, No. 3 (Washington, 1890). The question of the subdivision of the Nearctic region therefore remains open.

NEARING, nē'ring, SCOTT (1883-). An American economist, born at Morris Run, Pa. He studied at the University of Pennsylvania Law School in 1901-02 and took the S.B. degree at Pennsylvania in 1905 and the Ph.D. in 1909. He taught economics at Swarthmore College from 1908 to 1913 and (as instructor and then assistant professor) at the Wharton School of the University of Pennsylvania from 1906 to 1915. His dismissal from the latter institution, without notice, was generally supposed to be due to attacks made by Nearing upon corporations controlled by certain of the university trustees. The action resulted in widespread and vigorous protest. Deeply interested in the social aspects of economics and in social reform, he published, besides periodical articles *Economics* (1908), *Social Adjustment* (1911), *Solution of the Child Labor Problem* (1911); *Wages in the United States* (1911), *Woman and Social Progress* (1912), with his wife, *Social Religion* (1913); *Financing the Wage Earner's Family* (1914); *The New Education* (1915), *Income* (1915).

NEARSIGHTEDNESS. See SIGHT, DEFECTS OF.

NEATH, nēth. A municipal borough and river port in Glamorganshire, South Wales, on the Neath, 7 miles east-northeast of Swansea (Map England, C 5). The town, built on the site of the Roman station Nidum, contains the remains of an ancient castle, burned in 1231, and there is also the old parish church of St. Thomas. The town received its first charter from Edward II. It is chiefly notable for refining of iron and copper ore. It also manufactures tin plate, machinery (including steam engines), bricks, chemicals, and textiles. Stone is quarried near by, and there is a large export trade in local products. It owns its gas, water, slaughterhouses, markets, tramways, library, cemetery, the Victoria Gardens pleasure ground, a fair field, and real estate worth \$1,000,000. Pop., 1911, 17,586.

NEBENIUS, nē-bā'nē-us, KARL FRIEDRICH (1784-1857). A German statesman and economist, born at Rhodt, near Landau. In 1819 he took a prominent part in working out the Baden constitution and for many years was the principal statesman of the Grand Duchy. In 1833 he was made Privy Councillor of State and soon afterward became Minister of the Interior and President of the Cabinet Council. Owing, however, to reactionary influences, he did not keep this position very long, retiring in 1839. In

1845 he again joined the cabinet, but the revolution of 1849 compelled him to resign, and thereafter he devoted himself entirely to literary pursuits. He published, among many treatises on political economy *Betrachtungen über den nationalökonomischen Zustand Grossbritanniens in staatswirtschaftlicher Hinsicht* (1818); *Ueber technische Lehranstalten* (1833), *Baden in seiner Stellung zur deutschen Frage* (1850); and wrote a *Geschichte der Pfalz*, which appeared posthumously (1874).

NEBO (from Bab *nabû*, to call, name, proclaim). A deity of the Babylonians and Assyrians, mentioned in Isa xlv. 1. The name also occurs in the Old Testament as a geographical term. (See NEBO, MOUNT.) In cuneiform literature the form is Nabu or Nabium. It is no doubt Semitic and means "announcer," "proclaimer." He was consequently an oracle giver. He was the local patron deity of Borsippa, opposite the ancient city of Babylon, and it is possible that he was likewise the god of Babylon before the ascendancy of the Sumerian god Marduk, seeing that he maintained his position of importance even after Marduk had become the head of the Babylonian pantheon. (See MARDUK, MERODACH; BARYLON.) There was a shrine to Nebo in Marduk's temple at Babylon to which Nebo was carried in solemn procession on the New Year's Day, while the statue of Marduk was on the return trip carried part way back to E-zida (the true house), Nebo's temple in Borsippa. To express further the relationship to Marduk, Nebo was regarded as the son of Marduk. Nebo was the scribe among the gods (*tupshar*), the "bearer of the destiny tablets of the gods," the "writer of Esagil." As such naturally he became the god of wisdom, and it is in this capacity that he was chiefly worshiped by the Assyrians. To Nebo and his consort Tashmitum Assyrian rulers ascribe the art of writing on stone and tablets, and all learning is eventually traced back to him. In this respect he supplanted an earlier god of wisdom, Ea, whose cult reaches back to a still higher antiquity than that of Nebo or Marduk. He was identified with the planet Mercury. Consult Morris Jastrow, *Religion of Babylonia and Assyria* (Boston, 1898), id., *Die Religion Babyloniens und Assyriens* (Giessen, 1902-12); Zimmern, in Eberhard Schrader, *Die Keilschriften und das Alte Testament* (3d ed., Berlin, 1902); Alfred Jeremias, *Das Alte Testament im Lichte des alten Orients* (Leipzig, 1906); Condamin, in Joseph Huby, *Christus Manuel d'histoire des religions* (Paris, 1912).

NEBO, MOUNT. The mountain from which, according to the Book of Deuteronomy (xxxii 49, xxxiv 1), Moses viewed the land of Canaan before his death. It has been identified with the mountain Neba—a ridge 2643 feet above the Mediterranean, situated 5 miles southwest of Heshbon. The name Nebo also occurs as that of a town in Moab (Num. xxxii. 3 and on the Moabite stone) and a town in Judah (Ezra ii 29). It is identical in form with the name of a well-known Babylonian god Nabu (see NEBO), whose worship appears to have spread far to the west. The tradition associating the death of Moses with Mount Nebo may have had as a starting point the existence of a sanctuary on the top of the mount or, at all events, the sacred character of the mountain.

NEBRASKA (North American Indian, meaning flat or broad water). One of the north-cen-

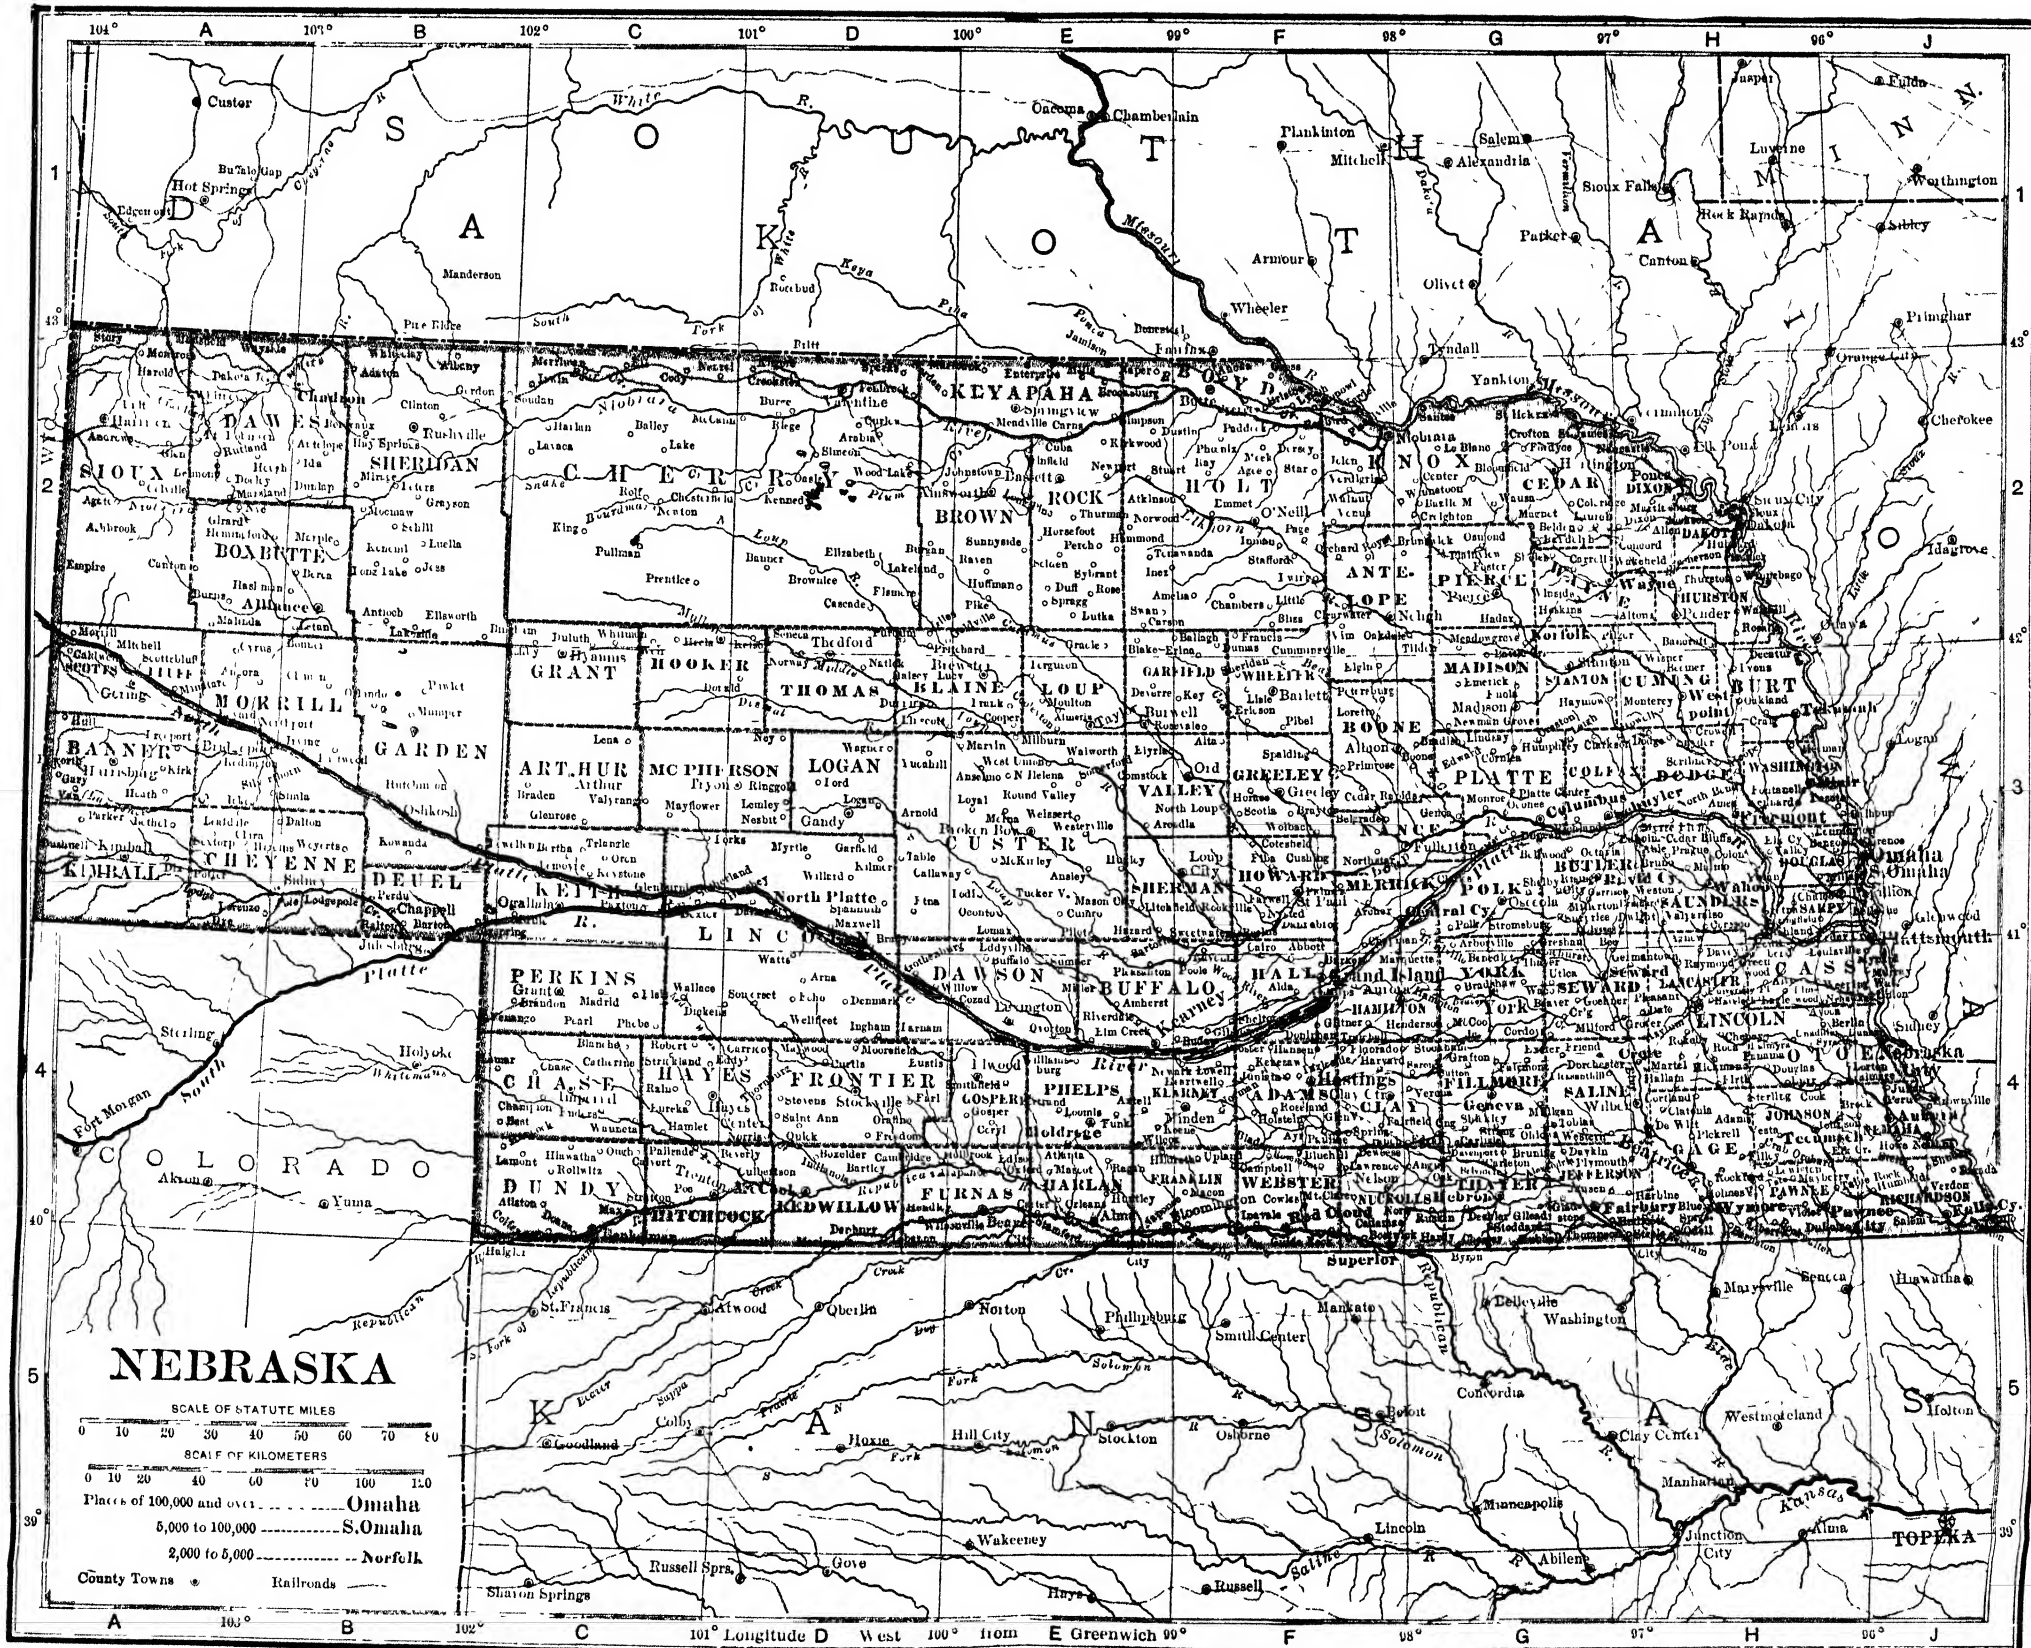

tral States of the American Union, popularly known as the Tree-Planter State. It lies between lat. 40° and 43° N. and between long 95° 20' and 104° W. It is bounded on the north by South Dakota, on the east by Iowa and Missouri, on the south by Kansas and Colorado, and on the west by Wyoming and Colorado. Its shape is that of a rectangle whose eastern end is cut off diagonally by the Missouri River and whose southwestern corner is overlapped by the northeastern corner of Colorado. Its extreme length from east to west is 455 miles, and its breadth from north to south 208 miles. Its area is 77,530 square miles, of which 712 square miles are water. It ranks fifteenth in size among the States.

Physiography. Nebraska lies in the region of the Great Plains skirting the east slope of the Rocky Mountains, towards whose foothills it rises in a gentle, undulating incline. Its whole western half lies at an elevation of more than 2500 feet above the sea. Though level in the central portion and along the lines of transcontinental travel, the land is rolling and surprisingly diversified. The physiographic relief varies from 842 feet at Rulo in southeast Nebraska to 5084 feet at Hogback Mountain, near the Wyoming line. The State has five well-defined physiographic regions—loess, drift, sand hills, bad lands, and buttes and plateaus. A line drawn from the southwest to the northeast corner divides the State into its two important physiographic regions, the agricultural loess plain in the southeastern half and the sand hills of the grazing region in the northwestern half. In the western and northwestern counties occur the famous Nebraska Bad Lands, and bordering them to the westward the butte and high plateau region.

Hydrography. The State is drained entirely by the Missouri River and its tributaries. Owing to the gentle and regular slope of the land, most of these rivers flow in nearly straight parallel lines eastward or southeastward, and they are for the most part wide and shallow. The three principal rivers, besides the Missouri (on the boundary), are the Platte in the center, the Niobrara in the north, both flowing through the whole length of the State, and the Republican in the south, the latter coming from Kansas and returning to that State to form the Kansas River.

Climate. The climate is continental, dry, and exhilarating. The mean temperature for January is 21.7° F and for July 74.5° F. The extremes are very great, the mercury sometimes falling to -35° F and even -45° F and at times rising to 114° F. The nights are cool. The climate of the western third of the State is, however, quite arid, and differs considerably from that of the eastern third, where agriculture is very successful. The annual rainfall is 23 inches, but this is very unevenly distributed. Averaging about 32 inches in the east, it is sufficient to support agriculture. In the western half it is below 20, and in the extreme west as low as 12 inches, so that here agriculture depends on irrigation and "dry-farming" culture. The greatest amount of rain falls in May and June, and more than three-fourths of the annual rain falls during the six months of the growing season, April to September. The prevailing winds of winter are from the northwest, while those of the summer are from the south and southeast.

Soils. More than half of the State is covered with glacial drift and loess, the drift being confined to the eastern counties. The loess deposits

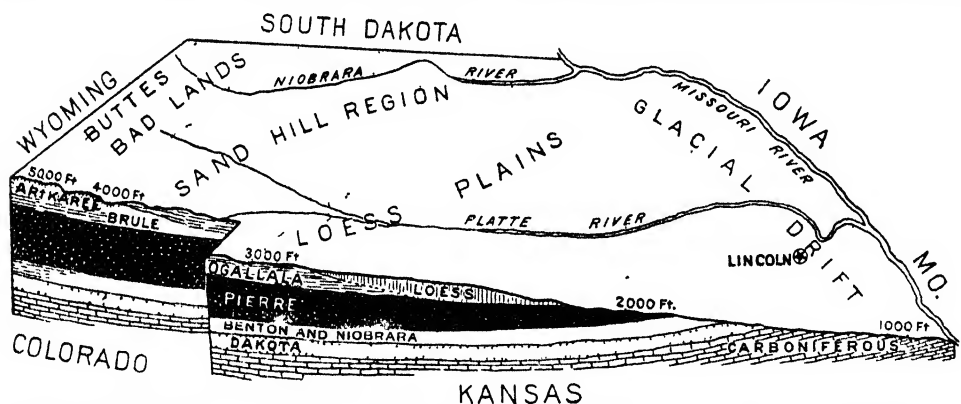

range in thickness from 5 to 150 and even 200 feet, and, though soft and easily excavated, are very compact and retentive of moisture. They form a soil of inexhaustible fertility. The bluffs along the bottom lands are composed of this material. The alluvial lands of the river valleys also afford an excellent soil, though scarcely exceeding the loess in quality. Considerable areas in the west, as much as 20,000 square miles, are covered with sand hills (qv). These are found partly in the southwest corner, but chiefly in the large and arid area north of the Platte and west of the one hundredth meridian.

In the extreme west the Tertiary marls, even in the Bad Lands, can be made productive by irrigation or "dry farming."

Geology. The rocks of Nebraska can be described as undisturbed sediment, the older dipping slightly to the west, where they disappear. The outcrops of all the successive formations have a direction slightly east of north, and are found along the narrow valleys of certain streams. The oldest beds are the Pennsylvanian, exposed in the southeastern corner from Lincoln eastward, consisting essentially of about 1200 feet of limestone interspersed with shale. At Lincoln the Carboniferous disappears. Triassic and Jurassic rocks are wanting, but the Cretaceous series is well developed

The paleofauna of this well-known collecting ground varies between wide limits, and has attracted paleontologists from all institutions and countries. The Bad Lands have a general elevation of about 3500 feet, and, although the rainfall is scant, the gradient is steep and the wash extensive. The Oligocene covers the western fourth of the State and has a total thickness of 500 to 600 feet. Next above the Bad Lands comes the Butte formation (mostly Arikaree) of Miocene age. Much of this butte region is covered with bull pines, *Pinus ponderosa*, hence the name Pine Ridge. Pliocene merging into Pleistocene covers the northern tier of counties from Brown westward. The glacial drift covers the eastern fifth of the State, and two divisions, the Nebraskan (or Jerseyan) and the overlying Kansan, are distinct. Much of this formation is confounded with the loess, which lies directly above the drift, and which varies in thickness up to 150 feet. It is a light buff deposit consisting essentially of fine silt and fine sand, with varying amounts of lime, clay, and humic matter. It is believed to be partly eolian and partly aqueous in origin. It is retentive of moisture, fertile, and productive, and constitutes an agricultural area of the utmost consequence.

Mineral Products. The minerals produced consist chiefly of clay products, mineral waters,

MAP OF NEBRASKA SHOWING BOUNDARIES, PRINCIPAL RIVERS, ALTITUDES, PHYSIOGRAPHIC DIVISIONS, AND GEOLOGY.

and underlies the entire State west of Lincoln. The Dakota (Cretaceous), composed of coarse ferruginous sand and clay, about 300 feet in thickness, outcrops from Jefferson County, through Lincoln in a general northerly and easterly direction to Dixon County. This is the water-bearing bed of the Great Plains. Twenty miles west of Lincoln some 20 feet of Graneros shales outcrop and are overlain by as many feet of Greenhorn limestone paralleling and overlying the Dakota, from Thayer to Dixon County. Just west of this, parallel to and superimposed upon it, comes 300 feet of Carlisle shale capped by 25 to 50 feet of Niobrara chalk. A line from Webster to Cedar County gives the general direction of the outcrops of these two formations. Next above these, and parallel to them, the Pierre shale outcrops in a general direction from Franklin to Knox County. The Pierre is the most extensive member of the Cretaceous, and attains a thickness of several thousand feet. Overlying the Pierre are many feet of early, middle, and late Tertiary beds, the oldest being the Bad Lands formation (Oligocene).

pumice, sand and gravel, sand-lime bricks and stone. The value of clay products in 1913 was \$886,166. In the production of pumice Nebraska enjoys almost a complete monopoly. The total value of mineral products in 1913 was \$1,433,718.

Agriculture. The entire land area is approximately 49,157,100 acres, of which 38,622,021 was in farms in 1910, these numbering 129,678. The average value of land per acre in 1910 was \$41.80, and the total value of farm property, including land, buildings, implements and machinery, domestic animals, poultry, and bees, \$2,079,818,647. Of the total number of farms, 80,237 were, in 1910, operated by owners and managers. In that year more than 70 per cent of the farms were from 100 to 500 acres in size.

There were, in 1910, 93,509 native white farmers out of a total of 129,678. The foreign-born white farmers numbered 35,707, and the negro and other nonwhites 462. Of the foreign-born white farmers, the greater number (15,478) were born in Germany.

The following table gives the acreage, produc-

tion, and value of some of the principal crops as estimated by the United States Department of Agriculture in 1914.

CROPS	Acreage	Prod bu.	Value
Corn	7,100,000	173,950,000	\$92,194,000
Wheat.	3,668,000	68,116,000	64,710,000
Oats	2,175,000	69,600,000	27,840,000
Barley	113,000	2,656,000	1,248,000
Rye	122,000	1,952,000	1,444,000
Peas	118,000	9,440,000	5,098,000
Potatoes	1,500,000	* 2,535,000	17,492,000
Hay	1,022,485	* 3,208,055	22,466,385
Alfalfa †			

* Tons † State Board of Agriculture Report

The total value of crops in 1909 was \$196,125,632, and the combined reported acreage 17,231,206, representing 70.7 per cent of the total improved land in farms. The general character of Nebraska agriculture is indicated by the fact that nearly 80 per cent of the total value of crops was contributed by the cereals and 16.2 per cent by hay and forage. Nebraska is one of the most important corn-producing States. Census figures for 1909 show, in corn, an acreage of 7,266,057, a production of 180,132,807 bushels, valued at \$88,234,846, in wheat, an acreage of 2,622,918, a production of 47,685,745 bushels, valued at \$44,225,930, in hay and forage, an acreage of 4,520,034, a production of 5,776,475 tons, valued at \$31,729,691, in oats, an acreage of 2,365,774, a production of 53,360,185 bushels, valued at \$19,443,570. The total acreage of potatoes and other vegetables was 147,594, the production being valued at \$5,931,738. Excluding potatoes and sweet potatoes and yams, the acreage of vegetables was 36,164. The production was valued at \$2,118,393.

A large quantity of orchard fruits is produced. This amounted in 1909 to 3,572,253 bushels, valued at \$1,932,124. Apples contributed more than nine-tenths of this quantity, peaches, nectarines, and cherries most of the remainder. The production of grapes in 1909 amounted to 4,752,217 pounds, valued at \$137,295. Strawberries are the most important of the small fruits, with blackberries and dewberries ranking next. The total acreage of small fruits in 1909 was 1411, and the production 1,594,421 quarts, valued at \$159,169. The growing of sugar beets has become an important industry. The total acreage of this crop in 1909 was 4191, and the production 39,874 tons, valued at \$180,247.

Live Stock and Dairy Products. Stock raising is of great importance. The total value of live stock on farms in 1910, including poultry and bees, was \$222,222,000. Cattle are raised in large quantities for market, and dairying is an important industry. The following figures are the estimates of the United States Department of Agriculture for Jan. 1, 1915: dairy cows, 625,000, valued at \$39,062,000, cattle, other than dairy cows, 2,034,000, valued at \$82,987,000; horses, 1,038,000, valued at \$95,496,000; mules, 85,000, valued at \$8,925,000, swine, 3,809,000, valued at \$41,518,000, sheep, 374,000, valued at \$1,795,000. The total value of milk, cream, and butter fat sold and butter and cheese made in 1909 was \$10,566,275. The milk sold amounted to 6,500,380 gallons, and the butter sold to 11,652,068 pounds. The total number of fowls of all kinds in 1910 was 9,351,830, valued at \$4,219,158.

Irrigation. Irrigation is practiced to a con-

siderable extent in the western part. In 1909, 1852 farms, or 1.4 per cent of the total number, were irrigated. The area of irrigated land in 1912 was 273,018 acres. Enterprises operating in 1914 were capable of supplying water to an area of 684,642 acres, and the total area included under all irrigation projects, completed or under way, was 951,000 acres.

Forest Products. The total forest area in 1908 was 800,000 acres, or less than 2 per cent of the total land area. The total value of the output of lumber in 1909 was \$2,021,366. In addition there were produced during the same year on the farms forest products valued at \$795,053.

Manufactures. In 1909 Nebraska ranked twenty-fifth among the States in the value of manufactured products, and the value per capita was \$167. The table (p 675) gives the most important figures relative to manufactures for 1909 and 1904.

Owing partly to the natural advantages for feeding cattle, and partly to location in the centre of the corn and cattle-raising sections of the country, the slaughtering and packing of meat is the most important industry. A large amount of live stock is bred in Nebraska, and much is brought from other States to be fattened for market. In 1909 the State ranked fourth in the value of such products.

The centre of the slaughtering and meat-packing industry is South Omaha, which is surpassed in this respect only by Kansas City, Mo., and Chicago. The importance of this industry is best indicated by the fact that in 1909 it gave employment to 24.7 per cent of the total number of wage earners engaged in all manufacturing industries and contributed 46.4 per cent of the aggregate value of products. Beeves slaughtered in 1909 numbered 651,258, sheep, 1,127,962, and hogs, 2,103,602. The total value of the fresh beef produced was \$26,914,613, and the pork was valued at \$8,624,522. Flour and gristmill products ranked second in point of industrial value. The most important of these products is white flour, of which there were produced, in 1909, 2,252,828 barrels, valued at \$11,379,662. Large quantities of graham flour, corn meal, rye flour, and buckwheat flour are also produced. Butter is the chief output of the dairies. Other important industries not mentioned in the table are those in connection with the manufacture of men's clothing, gas, artificial stone, paint and varnish, confectionery, brick and tile, and tobacco.

The total number of wage earners in 1909 was 24,336, of whom 20,941 were males. The wage earners 16 years of age and under numbered 217, of whom 178 were males. For the great majority of wage earners the prevailing hours of labor range from 54 to 60 a week and from 9 to 10 hours a day.

The four cities having a population of over 10,000 in 1910, Omaha, Lincoln, South Omaha, and Grand Island (qq.v.), gave employment to 70.2 per cent of the total number of wage earners and produced 81.5 per cent of the total value of products. South Omaha, engaged almost exclusively in the slaughtering and meat-packing industries, had in 1909 a manufacturing output valued at \$95,435,712. Omaha, which in 1909 had 8023 wage earners, manufactured products valued at \$60,824,550. The smelting and refining of lead is by far the most important industry of this city.

Transportation. The eastern and more popu-

lous section of the State greatly exceeds in mileage the western, which has but one line running north and south. The State is crossed from east to west by three large railroad systems—the Chicago, Burlington, and Quincy, the Union Pacific, and the Chicago and North-

845,000; surplus, \$8,012,335; cash, etc., \$3,204,023, loans, \$96,132,273; deposits, \$87,786,114. On April 21, 1915, there were 772 State banks with a capital of \$16,420,000; surplus, \$3,985,311; cash, \$5,297,151; loans, \$95,629,881; total individual deposits, \$100,952,813

SUMMARY FOR 1909 AND 1904
THE STATE—TEN LEADING INDUSTRIES

INDUSTRY	Cen- sus	Number of estab- lish- ments	PERSONS ENGAGED IN INDUSTRY		Capital	Wages	Value of products	Value added by man- ufacture
			Total	Wage earners (average number)				
All industries	1909 1904	2,500 1,819	31,966 25,336	24,336 20,260	\$99,901 80,235	\$13,948 11,022	\$199,019 154,918	\$47,938 30,866
Bread and other bakery products	1909 1904	279 138	1,155 567	646 383	1,092 654	373 188	3,014 1,351	1,342 631
Butter, cheese, and condensed milk	1909 1904	37 40	602 390	383 253	2,975 1,861	256 137	7,681 3,326	1,240 654
Cars and general shop construction and repairs by steam-road companies	1909 1904	13 30	4,021 3,626	3,685 3,245	6,311 5,975	2,271 2,109	4,642 4,395	2,918 2,478
Flour-mill and gristmill products	1909 1904	249 234	1,455 1,324	839 863	9,472 6,497	519 468	17,836 12,190	2,619 2,037
Foundry and machine-shop products	1909 1904	73 46	1,346 626	1,020 518	2,808 920	595 287	2,930 1,092	1,414 664
Leather goods	1909 1904	30 22	365 364	266 247	988 906	197 146	1,583 983	605 447
Liquors, malt	1909 1904	14 16	517 338	424 265	3,999 2,558	290 186	3,335 1,664	2,710 1,205
Lumber and timber products	1909 1904	48 27	707 416	543 356	1,155 379	356 234	2,021 645	795 381
Printing and publishing	1909 1904	674 631	3,884 3,326	2,329 2,073	4,979 3,616	1,397 1,093	6,667 4,991	4,956 3,697
Slaughtering and meat packing	1909 1904	18 9	7,221 6,462	6,015 5,590	19,414 20,606	3,372 3,159	92,305 69,329	13,947 8,051

western. The total steam-railroad mileage of main track in 1914 was 6148. The most important lines and their mileage are the Chicago, Burlington, and Quincy, 2850; the Union Pacific, 1184, the Chicago and Northwestern, 1071, the Missouri Pacific, 371, the Chicago, Rock Island, and Pacific, 246, the Chicago, St. Paul, Minneapolis, and Omaha, 308, the St. Joseph and Grand Island, 112. The total mileage of electric railway in 1914 was 220. The steam and electric railways are under the complete jurisdiction of the State Railway Commission.

Banks. The first session of the Territorial Legislature in 1855 pronounced currency banking a crime, and no banks were chartered. The necessity for currency, however, was such that insurance companies issued a disguised form of paper money. In 1856, under special charters, certain institutions did a banking business, in spite of the laws to the contrary. The general panic of 1857 swept all such institutions out of existence. For almost a decade all the banking business was performed by private banks, then national banks began to be organized.

A considerable increase in the number of banks came about in 1880, when the era of railroad building commenced. An Act regulating banks was passed in 1889, establishing a State Banking Board and providing for reports and examinations. In 1909 Nebraska passed a bank guaranty act, which has proved very successful in operation. In 1893 there were eight savings banks in Omaha, but only one existed in 1900. On Sept. 12, 1914, there were 220 national banks with an aggregate capital of \$15,-

Government. The present constitution was adopted in 1875. Amendments may originate in either branch of the Legislature or among the people, but to become a part of the constitution must be agreed upon by three-fifths of the members of each House and carried by a majority of the electors.

Legislative.—The Legislature consists of a Senate and a House of Representatives. The House of Representatives, by reapportionment made in 1911, consists of 77 members, and the Senate of 28 members. The number of Representatives must never exceed 100 nor the Senators 33. Sessions of the Legislature are biennial and begin on the first Tuesday in January in the year next following the election of members. After the expiration of 20 days of the session, no bills or joint resolutions of the nature of bills may be introduced, except with regard to matters relative to which the Governor shall, in special message to the Legislature, call its attention to the necessity of legislation. The initiative and referendum have been adopted and are in full force. The term of office for both Senators and members of the House is two years.

Executive.—The executive department of the State consists of a Governor, Lieutenant Governor, Secretary of State, Auditor of Public Accounts, Treasurer, Superintendent of Public Instruction, Attorney-General, and Commissioner of Public Lands and Buildings. Each holds office for the term of two years. The Governor and Lieutenant Governor must have attained the age of 30 years. The Treasurer is ineligible to the office for two years next after

the expiration of two consecutive terms for which he was elected.

Judiciary.—The judicial power is vested in a supreme court, district courts, county courts, justices of the peace, police magistrates, and such other inferior courts as may be created by the Legislature. The State is divided into six judicial districts, in each of which there is elected, for a term of four years, one judge of the district court. In each organized county there is elected for two years a judge of the county court.

Suffrage and Elections.—Every male person of the age of 21 years or upward, who has resided in the State for six months and in the county, precinct, or ward for the term provided by law, may be an elector, provided that he is a citizen of the United States or that he, if a person of foreign birth, shall have declared his intention of becoming a citizen at least 30 days prior to the election. The general election is held every two years, on the Tuesday next succeeding the first Monday in November. All candidates for elective offices, except those expressly excepted, are nominated by primary elections. Provision is made for the preference vote for President and Vice President of the United States and for United States Senator. There is a stringent corrupt-practices act, limiting and regulating the expenditures of candidates for office.

Local and Municipal Government.—The Legislature may form no new county of an area less than 400 square miles nor reduce any county to less than that area. Counties may organize into townships whenever a majority of the legal voters of such county shall so determine. Cities of the first class (between 5000 and 100,000 in population) may frame a charter for their own government.

Miscellaneous Constitutional and Statutory Provisions.—Property acquired by a wife after marriage remains separately her own. Women who own assessed property or who have children of school age may vote in school meetings. The sale of liquor is regulated by local option. Under the State law, however, all saloons are compelled to close at 8 p.m. and remain closed until 7 a.m. There is also a law forbidding the sale of liquor on dining cars and in all territory within 2 miles of an incorporated city or village.

Finance. Nebraska has no bonded or funded debt. The floating debt, composed entirely of outstanding warrants, amounted, on Nov. 30, 1912, to \$374,394. The State constitution provides that the revenue from certain sources be set aside for a perpetual common-school fund, the income only being available. The fund in 1912 amounted to \$8,482,143. The university fund, amounting to \$218,377, was derived from the sale of 45,426 acres of land granted by Congress. Other funds include the agricultural college fund, amounting in 1912 to \$545,064, the normal endowment fund, and general and special funds. The debt per capita was 31 cents in 1912. The total receipts for one year ending Nov. 30, 1914, were \$6,451,742; the expenditures, \$6,346,034. On that day there was a balance of \$746,108 in the treasury.

Militia. The males of militia age (18-44) in 1910 numbered 267,497. The organized militia comprises one brigade, including two regiments of infantry, a company of signal troops, and a detachment of sanitary troops. The total

strength in 1915 was 1264 privates and 131 officers.

Population. The population by decades is as follows. 1860, 28,841; 1870, 122,993; 1880, 452,402; 1890, 1,058,910; 1900, 1,066,300; 1910, 1,192,214. The estimated population in 1914 was 1,245,873. The population per square mile in 1910 was 15.5, compared with 13.9 in 1900. The larger part of the population is in the southeastern counties, the western half being, on account of its aridity, rather sparsely populated. The urban population, i.e., that of places of 2500 or over, in 1910 was 310,852, and the rural 881,362. The foreign-born population numbered 24,361; native whites of foreign or mixed parentage, 362,353, and negro, 7689. The largest number of foreign-born whites came from Germany. The population was divided in 1910 into 627,782 males and 564,432 females. The males of voting age numbered 353,626. The largest city is Omaha with a population in 1910 of 124,096 and in 1914 (estimated) of 133,274. Some other cities with their populations in 1910 and 1914 (estimated) are as follows: Lincoln, 43,973, 45,643; South Omaha, 26,259, 26,368; Grand Island, 10,326, 11,505; Hastings, 9338, 10,252; Fremont, 8718, 9345.

Education. The general excellence of educational conditions in Nebraska is indicated by the fact that only one other State, Iowa, had a smaller percentage of illiteracy in 1910. Of a population of 10 years of age and over numbering 924,032, there were in that year 18,000 illiterates. The percentage of illiteracy among the native whites of native parentage was 0.6, among foreign-born whites 7.1, and among the negroes 7.2. According to the thirteenth census the total school population, ages 6 to 20 years, was 373,868, and of this number 261,219 were attending school. The report of the State Superintendent of Education for 1914 shows a total school population (ages 5 to 21 years) of 383,882, a total school enrollment of 288,369, and an average daily attendance of 214,152. The total number of teachers employed in that year was 12,018, of whom 10,549 were women and 1449 men. The average monthly salary of men teachers was \$84.25 and of women teachers \$58.70. The total expenditure for public schools is over \$10,000,000 per year. There were 240 accredited high schools in 1913. In addition there were 192 nonaccredited high schools approved by the State Superintendent under the free-high-school law. Special attention has been given in recent years to agricultural training in the high schools, and in 1913 legislation was enacted permitting qualified high schools to give training in agriculture, manual training, and home economics. The State has a free-textbook law. The State normal schools are situated at Peru, Kearney, Wayne, and Chadron. The University of Nebraska, a part of the educational system of the State, is situated at Lincoln. The other institutions of higher education, all coeducational, are Bellevue College at Bellevue, Cotner University at Bethany, Union College at College View, Doane College at Crete, Grand Island College at Grand Island, Hastings College at Hastings, University of Omaha at Omaha, the Nebraska Wesleyan University at University Place, and York College at York. Creighton University at Omaha is a Roman Catholic institution for men. There is also a school of agriculture at Curtis.

Charities and Corrections. The charitable and correctional institutions under control of the State include the Institute for the Blind at Nebraska City, the Institute for the Deaf and Dumb at Omaha, the Institute for the Feeble-Minded at Beatrice, the Industrial School for Juvenile Delinquents at Kearney, a Girls' Industrial School at Geneva, an Industrial Home for Girls at Milford, asylums for the insane at Lincoln, Norfolk, and Hastings, an Orthopedic Hospital for Crippled and Deformed Children at Lincoln, soldiers' and sailors' homes at Grand Island and Milford, the State penitentiary at Lincoln. There are a juvenile-court law and a board of control for dependent and neglected children. Prisoners may be subjected to an indeterminate sentence and have, at the discretion of the State Prison Board, the privilege of parole.

Religion. The Church members or communicants in the State form only about 30 per cent of the total population. The principal denominations in order of their numerical strength are the Roman Catholic, comprising over one-fourth of the Church members, Methodist, Lutheran, Presbyterian, Christian, Baptist, and Congregational.

History. The territory now constituting the State was originally a part of the Louisiana Purchase and afterward a part of Missouri Territory. Coronado (qv), setting out from Mexico in search of the seven cities of Cibola and of Quivira, claimed that in 1541 he journeyed on the great plain as far as lat. 40° N., the southern boundary of the State. There are stories of other Spanish explorations, but little is known of them. In 1673 Marquette passed the mouth of the Missouri and marked the Platte from Indian stories. Pierre and August Chouteau, brothers engaged in the fur trade, reached the Platte about 1807. Lewis and Clark, in 1804-06, skirted the eastern boundary of the present State. The *Trudeau Journal* (discovered 1912) shows there were trading posts as early as 1794. The American Fur Company placed one at Bellevue in 1810, and posts were established at Omaha in 1825 and at Nebraska City in 1826. Fort Atkinson was established in 1819, but abandoned in 1827. With the admission of Missouri as a State in 1821, the territory was left practically without government. In 1834 part of the western Indian country was attached to Arkansas, the jurisdiction of the district court at Missouri was extended over another part, and a third portion was joined to Michigan Territory. The next year Col. Henry Dodge, with a force of dragoons from Fort Leavenworth, marched up the Platte valley to the forks and thence up the South Platte to the mountains. Many tribes of the Eastern Indians were then being transferred to this "Indian country."

New Fort Kearney was established on the Oregon trail in 1848.

Thousands of gold seekers passed through the Territory in 1849-50, and some stopped on the way in utter defiance of the law which forbade settlement among the Indians. The partly civilized tribes near Fort Leavenworth, who foresaw the inevitable extension of white settlement, wished for a territorial government in order to sell lands to better advantage. The Wyandots, led by their half and quarter bloods, in 1851-52 petitioned Congress to establish a Territory, with no success. A territorial dele-

gate, Abelard Guthrie, was chosen in October, 1852. A bill to organize Nebraska Territory passed the House Feb. 2, 1853, but did not reach a vote in the Senate. In order to force action, a provisional government was organized by the residents, and William Walker was elected Governor July 25, 1853. Senator Douglas reported a bill in January, 1854, providing for the erection of a Territory, based on his principle of "squatter sovereignty." It was amended to provide for two Territories (see KANSAS-NEBRASKA ACT), passed both Houses, and was signed by the President May 30. By this Act the boundaries of the Territory of Nebraska were defined as the fortieth and forty-ninth parallels of latitude, from the Missouri to the summit of the Rocky Mountains. In 1861 all the region north of the forty-third parallel was constituted part of Dakota Territory, a small part from the southwest corner was added to Colorado, and the western boundary was extended to the one hundred and tenth meridian. With the creation of Idaho Territory from the northwestern portion of Nebraska in 1863, the State was reduced to its present limits except for a slight addition in the northeast in 1882.

Congress passed an enabling Act in 1864, but not until 1866 was a constitution adopted. The act of admission passed by Congress July 18 was not signed by the President. In February, 1867, he again vetoed a similar bill, but it was passed over the veto, and on March 1 the State was admitted.

Nebraska from its establishment as a State to 1896 was Republican in politics. Since that year, however, the Democrats have practically equaled the Republicans in strength. Both Republican and Democratic parties have been split by factional disturbances. Nebraska was more conservative than some of its neighboring States in the adoption of the more radical principles of government favored by insurgent or progressive wings of both parties. The "Progressives," however, attained considerable strength and succeeded for several years in electing their candidate to Congress. In the election of November, 1908, Bryan received 131,099 votes; Taft, 126,997; Chafin, 5179; Debs, 3524. The Democrats elected their candidate, A. C. Shallenberger, for Governor, and a Democratic Legislature. The Republicans elected the remaining State officers. In the State elections held in 1910 the Republicans elected their candidate, Chester H. Aldrich, Governor, and the Democrats a United States Senator, Gilbert M. Hitchcock. In 1912 the Progressive party, endorsing the Republican candidates chosen at the primaries, had no candidates for State offices. They did, however, elect delegates to vote for Mr. Roosevelt at the National Progressive Convention. In 1912 Wilson received 109,008 votes; Roosevelt, 72,678 votes; Taft, 34,216 votes; Debs, 10,185 votes; and Chafin, 3383 votes. The Democrats elected J. H. Morehead Governor by about 10,000 plurality, and Mr. Norris received the popular preferential vote for United States Senator. In this election several amendments to the constitution were carried, among these a provision for the initiative and referendum. Governor Morehead was reelected Governor by a plurality of about 20,000 votes. The following is a list of the Governors of the State, with their party affiliations.

TERRITORIAL

Francis Burt	1854
T. B. Cumming (acting)	1854-55
Mark W. Izard	1855-57

NEBRASKA. A river of Nebraska. See PLATTE.

NEBRASKA, UNIVERSITY OF A State university for higher education founded at Lincoln, Neb., in 1869 and opened to students in September, 1871. The university forms a part of the educational system of the State. The governing body is the board of regents, which includes six members who are elected, but was formerly composed of 12 members who were appointed. Included in the university are the following colleges, each of which has its own faculty: arts and sciences, agriculture, engineering, graduate, law, medicine, teachers. A summer session is also maintained. Tuition in the university is free to residents of Nebraska in all of the colleges except the so-called professional colleges; undergraduate students who are nonresidents of the State and resident students in professional colleges pay a moderate tuition. All departments are open to both men and women. The chief sources of support are a tax of one mill per dollar of the grand assessment roll of the State, with interest from endowment land leases on sales and on permanent fund investments. The university also benefits by United States appropriations under the Morrill acts for instruction in agriculture and the mechanic arts, the Hatch-Adams acts aiding agricultural experimentation, and the Smith-Lever Act of 1914 aiding agricultural extension. On the campus in Lincoln are 13 buildings which

house all the departments except a medical school, which is located at Omaha, and a school of agriculture and an experiment station conducted on the university farm of 320 acres near the city of Lincoln. The libraries of the various colleges contain 116,000 bound volumes, and the museums contain large and valuable collections. The total enrollment in all departments in 1913-14 was 4133. There were 281 members of the faculty, including 83 professors, 20 associate professors, 46 assistant professors, 68 instructors, and 64 assistants. The Legislature of 1914 provided for a special three-fourths of a mill levy upon the grand assessment of the State, continuing for six years, for securing an extension of grounds in the city of Lincoln and for new buildings and their equipment on both the city campus and the university farm, approximately \$2,300,000 will be spent for the new physical plants. The chancellor in 1915 was Samuel Avery, Ph D.

NEBRASKA CITY. A city and the county seat of Otoe Co., Neb., 53 miles south of Omaha, on the Missouri River, here spanned by a fine steel railroad bridge, and on the Missouri Pacific and the Chicago, Burlington, and Quincy railroads (Map Nebraska, J 4). It has a United States government building, St. Bernard's Academy (Belgian) for young ladies, a fine monument to J. Sterling Morton, the State Institute for the Blind, and a public library. The city is the centre of a noted fruit belt and of a rich corn region. The principal industrial plants include large stockyards, canneries, grain elevators, flour mills, lumber and planing mills, foundries, press-drill works, a starch factory, packing and provision house, breweries, brickworks, windmill, cigar, vinegar, and pickle factories, and a cold-storage plant Arbor Lodge, the old homestead of J. Sterling Morton, has been developed into a magnificent estate of 900 acres and contains the finest arboretum in the State. Settled in 1855 on the site of old Fort Kearney, Nebraska City was incorporated as a city of the second class in 1871 and received a charter of the first class in 1891. It has since adopted the commission form of government. Pop., 1900, 7380, 1910, 5438

NEBRASKA WESLEYAN UNIVERSITY. A coeducational institution for higher education founded at University Place, Neb., in 1886. It is under the control of the Methodist Episcopal denomination. The university includes a college of liberal arts, a teachers' college, a conservatory of music, a school of expression and oratory, a school of art, a teachers' training course, and an academy. The total enrollment in all departments in 1914-15 was 840, and the faculty numbered 34. The university has a productive endowment of about \$350,000, and the college grounds and buildings are valued at \$305,800. The annual income is about \$65,000. The library contains 8000 volumes. The chancellor of the university in 1915 was Clark A. Fulmer.

NEBRIJA, nă-bré'ná, or **LEBRIJA**, lá-bré'ná, ANTONIO DE (1444-1522). An eminent Spanish humanist, whose real name was Antonio Martínez de Jarava. From the city of his birth (Nebrija, or Lebrija) he became known as Antonio Nebrihensis. One of the most important leaders of the revival of learning in Spain, he was tutor to Queen Isabella, collaborator with Cardinal Ximenes on the celebrated Complutensian Polyglot Bible, and professor for

many years at the University of Alcalá. His works may be classified as philological, poetical, historical, juridical, medical, and theological. Aside from his chronicle of the reigns of Ferdinand and Isabella, his most important works are the *Dictionarium Latino Hispanicum et Hispanicum Latinum* and the *Gramática sobre la lengua castellana*, both published in 1492, when there were no similar works in any other modern language.

NEBRIS, nēb'ris. See DIONYSUS.

NEBRIS/SA VENERIA. See LEBRIJA.

NEBUCHADNEZZAR, nēb'ū-kād-nēz'zēr, or, more correctly, **NEBUCHADREZZAR** (Heb., from Bab *Nabu-kudūrri-usur*, Nabu [Nebol], protect the boundary). The great King of the Chaldean Empire, who ruled 605-562 B.C. He was the second of the name, Nebuchadnezzar I having been a distinguished monarch of the fourth dynasty of Babylon, reigning c.1160-1140 B.C. He was the son of Nabopolassar, Viceroy of Assyria in Babylonia, who, after the death of Asurbanipal, gained control of the Babylonian portion of the latter's empire in 625 B.C. The family was Chaldean, hence the use of this name for the dynasty and for the land in later ages. (See CHALDEANS.) Nabopolassar entered into alliance with Psammetichus of Egypt. Nineveh was saved in 625 by the appearance of Assyria's ally, the Scythian King Madyas, who drove away the Medes. But a second attack by the Medes, supported no doubt by the Chaldeans, led to the fall of Nineveh in 606 B.C. The Assyrian Empire was forthwith partitioned, the Medes took possession of the upper Tigris valley and the lands to the north and east of the Euphrates, Nabopolassar made firm his control of the Euphrates valley, and from the west Necho, King of Egypt, advanced to the great river to reclaim for his land its ancient dominion in Syria. The division of spoils between Media and Babylon seems to have been prearranged, but Egypt's intrusion could not be suffered, and Nabopolassar sent Nebuchadnezzar against Necho. The latter seems to have been defeated at Carchemish (605 B.C.). But he was recalled by the news of the death of his father. Unfortunately we possess but scanty materials for the study of the continuation of Nebuchadnezzar's military and political career. The sources are, besides a few inscriptions, the partial accounts found in the Bible, Josephus (quoting Berosus; *Ant.*, x, 6-11, c. *Ap.*, i, 21), and Herodotus (containing obscure information concerning Egypt; ii, 151 et seq.) and a fragment of Menander. The books of Kings, Jeremiah, and Ezekiel enable us to follow to some extent Judah's relation to its new lord. At first King Jehoiakim submitted, but about 600 B.C. rebelled. After some delay Nebuchadnezzar sent his army against Jerusalem, which fell in 597, Jehoiakim dying during the siege. His son, Jehoiachin, suffered the Imperial chastisement of exile along with 10,000 citizens, an uncle, Zedekiah, being appointed to the throne by the conqueror. But the new King succumbed at last to the temptations to revolt offered by his neighbors, especially by Hophra (see APRIES), the ambitious King of Egypt, and drew upon himself the wrath of the great King. Jerusalem stood a siege of 16 months, but fell

in 586 B.C. Zedekiah was blinded, the city was in part destroyed, almost 4000 Jews were carried away into exile and a smaller number in 581 B.C. (See JEWS.) This campaign broke the refractory spirit of the Syrian states, Tyre alone holding out and suffering a famous siege of 13 years, which ended in a truce and the rather ignominious departure of the Chaldean army, which had labored in vain outside its walls. In 568 B.C. occurred a campaign which carried Nebuchadnezzar into the heart of Egypt, where, however, he obtained no permanent results. But it is the glory of this King that he prided himself not on the arts of war (he seems to have prosecuted them only at necessity), but on his works of peace. Most of his inscriptions are devoted to his building operations, especially in Babylon, which, destroyed as it had been by Sennacherib and since then racked by civil war, he rebuilt and restored to more than its pristine glory. The excavations of the Germans under Dr. Koldewey have uncovered the extent and grandeur of the fortifications, the palace, the temple of Marduk, and the great Procession Street, which Nebuchadnezzar reared out of patriotism and an eminent devotion to the gods. The sister city Borsippa shared in his benefactions, and he built or repaired temples in Sippara, Cutha, Uruk, Larsa, Ur, and other cities. Nebuchadnezzar's outward successes seem to have been based upon noble kingly qualities. His son Amil Marduk (see EVIL MERODACH) succeeded him, but was assassinated after a reign of two years (562-560). He was followed by his brother-in-law, Nergal-sharusur (Neriglissor), the son of Belshum-ishkun (560-556). Labashi Marduk, his son and successor, was murdered after only nine months' reign. He was the last descendant of Nebuchadnezzar who sat upon the throne, Nabonidus (q.v.), the last King of Babylon, being a native Babylonian and not a Chaldean. For Nebuchadnezzar's inscriptions, consult: Ball, in the *Proceedings of the Society for Biblical Archaeology*, vols. x-xi (London, 1888-89); H. Winckler, *Keilinschriftliche Bibliothek*, vol. iii, part ii (Berlin, 1892); Langdon, *Building Inscriptions of the Neo-Babylonian Empire* (Paris, 1905), id., *Neobabylonische Königsinschriften* (Leipzig, 1912). For excavations in Babylon, consult Koldewey, in *Mittheilungen der deutschen Orient-Gesellschaft* (Berlin, 1899-1913), and id., *Das Wiederaufstehende Babylon* (Leipzig, 1913). See also BABYLONIA and the literature quoted under that article.

NEB'ULA, IN MEDICINE. See LEUCOMA.

NEB'ULÆ (Lat. nom. pl., clouds, vapors, mists). Patches of luminous matter occurring in considerable numbers in various parts of the sky and differing from the stars in that they do not present simply small definite points of light, but rather large surfaces of widely varying brilliancy. We have acquired much exact knowledge about the nebulae, especially in recent years, since the application of photographic processes to astronomical observation, and they have also been made the subject of extensive philosophical theories as to the origin, development, and construction of the universe, some of which are based upon too many hypothetical considerations to receive the unqualified assent of astronomers.

Only two nebulae are visible to the naked eye: that in Andromeda and the great nebula in Orion. The former consists of an oval mass

of light about three times as long as it is broad and surrounded with several more or less distinct disconnected oval rings. There is also a central condensation in the middle of the whole mass. The Orion nebula, on the other hand, is of quite irregular shape, contains a number of stars, and is indented with at least one very large nonluminous break known as the fish mouth. Both these large nebulae, in the telescopic field of view, cover a space of more than one square degree on the sky's surface. When tested by long-exposure photographs, they are found to be of truly gigantic size. It is now admitted that the entire constellation of Orion is included in the outlying parts of the great nebula. Condensations appear to fasten about the stars of the constellation, and indeed the conclusion seems irresistible that we are looking upon a universe in course of formation out of plastic and gaseous material. Many of the less conspicuous nebulae are round or oval, often have a stellar central condensation, and sometimes one of a disklike form with uniform surface luminosity. These are the so-called planetary nebulae. Then there are annular, or ring-shaped, nebulae and spiral nebulae. These last look like great whirlpools of matter apparently rotating rapidly and trailing long streamers of light. The very latest results in nebular photography seem to indicate that the spiral form is in fact the most prevalent one. The application of the spectroscope, and especially the spectrograph, to nebular study has proved that many nebulae are really gaseous in constitution and not simply aggregations of stars too small and close together to be separated even by our most powerful telescopes. It has also been possible to measure with the spectroscope the velocity with which some of the nebulae are moving through space in the direction of our solar system, and it is found that nebular velocities are of about the same order of magnitude as those observed in the case of ordinary stars. As to the changes of the shape and form of individual nebulae, we have no decisive evidence. Indeed, the outlines of these objects are so hazy that no reliance can be placed upon ordinary drawings, and even photographs can mislead us, since what we see upon them depends in great measure upon the length of time during which the sensitive plate was exposed to the light of the nebula. The number of the nebulae at present known is not far from 10,000, and the best catalogue of them is by Dreyer, published in the *Memoirs* of the Royal Astronomical Society of London.

As to their distance, our knowledge is still in the conjectural stage. No one has yet measured a nebular parallax (see PARALLAX) successfully, but it is extremely probable that their distances, like their velocities of motion, are of the same order of magnitude as the corresponding quantities for the fixed stars.

The theory of cosmic evolution known as the nebular hypothesis of Laplace aims to account for the origin and development of our solar system, beginning with a presupposed mass of formless matter. This mass, assuming a rotation under the influence of natural forces, might be expected to take upon itself the form of a flattened sphere; and if a contraction of its bulk should occur after the lapse of ages of time, certain rings of matter might be left behind, as it were, by the contracting mass. Such

rings have indeed a certain analogy in the Andromeda nebula, and, their possible formation once granted, there is nothing to prevent the gradual breaking up of a ring under the action of gravitational forces. Its matter might then be gathered into a single ball, and thus would be formed a planet circulating in an orbit around the central condensing mass destined in later ages to form the sun itself. It will be seen that this hypothesis, while plausible, rests upon a basis of imagined possibilities rather than ascertained facts. While, therefore, it is most interesting, it must on no account be reckoned among those astronomical theories (such as gravitation) whose foundation is as strong as that underlying any of the scientific truths coming within the range of human knowledge. See ASTRONOMY, COSMOGONY.

Consult Isaac Roberts, *A Selection of Photographs of Stars, Star Clusters, and Nebulae* (2 vols., London, 1894-1900), and A. M. Clarke, *The System of the Stars* (2d ed., 1b, 1905).

NEBULAR HYPOTHESIS. See COSMOGONY, NEBULÆ.

NEB'ULY, or **NEBULE** (Fr. *nébulé*, from OF *nebule*, cloud, from Lat. *nebula*, Gk. *νεφέλη*, *nephelē*, Skt. *nabhas*, OChurch Slav. *nébo*, cloud). One of the partition lines in heraldry (q.v.), which are intended to represent the clouds and hence are drawn horizontally.

NECCI. See CHESTNUT.

NECESSARIES (Lat. *necessarius*, requisite, indispensable, from *neccesse*, OLat. *neccessum*, indispensable, from *ne*, not + *cessus*, pp. of *cedere*, to yield). In its technical legal sense, such articles as are reasonably suitable or necessary to maintain a person in the condition in life which he occupies at the time they are furnished. The use of the term in this sense resulted from the doctrine of the common law that married women, infants, lunatics, or any incompetent persons cannot be held on their contracts, and in order to obviate the harsh effect of this rule, the courts adopted the policy of holding such persons for any articles furnished them which were actually necessary to sustain life. The courts continued the use of the word "necessary," but have extended its legal meaning until to-day it is a very elastic term. It is not limited only to food and clothing sufficient to sustain life, but may include articles which might be considered luxuries by persons in some stations in life, according to the circumstances of the case. In order to determine whether an article is a necessary, the character of the article itself, the use for which it was designed, the age, social position, wealth, and previous mode of living of the person to whom it was furnished must be considered. These are questions of fact and must, therefore, be submitted to a jury. See BANKRUPTCY, CONTRACT, HUSBAND AND WIFE; INFANT, LUNATIC; and consult authorities referred to under CONTRACT, ETC.

NECHES, nēch'ez. A river of eastern Texas, rising in Van Zandt County and flowing southeast into Sabine Lake, whence its waters, with those of the Sabine River, find their way by Sabine Pass into the Gulf of Mexico (Map Texas, E 4). It is about 350 miles long and waters a wide and fertile portion of Texas.

NECHO, nē'kō (Egypt *Nekau*). The second King of the twenty-sixth Egyptian dynasty, called Pharaoh-necho in the Bible (2 Kings xiii. 29 et seq.) and Nechos, Nechaus, etc., by

Greek writers. He succeeded Psammeticus I and reigned from 610 to 594 B.C. On the downfall of the Assyrian Empire, Necho attempted to gain possession of Syria (Breasted, 609) and, at the outset of his campaign, defeated and slew Josiah, King of Judah, who opposed him at Megiddo. Jehoahaz, the son of Josiah, after a brief reign of three months, was deposed by the Egyptians. Eliakim, who changed his name to Jehoiakim, was made King by Necho in place of Jehoahaz, and Judah was subjected to a tribute of 100 talents of silver and one of gold. Necho conquered Syria as far as the Euphrates, but was completely defeated at Carchemish by the Babylonian Crown Prince Nebuchadnezzar (605 B.C.) and lost all his conquests. Although unable to cope with the Babylonian Empire, Necho was an active and energetic ruler. He unsuccessfully attempted to construct a canal from the eastern arm of the Nile to the Red Sea, a precursor of the modern Suez Canal. Necho also built a fleet and sent it, manned by Phœnician sailors, on an exploring expedition around Africa. Consult Alfred Wiedemann, *Geschichte Aegyptens von Psammeticus I bis auf Alexander den Grossen* (Leipzig, 1880); E. A. T. Wallis Budge, *A History of Egypt* (New York, 1902); J. H. Breasted, *A History of the Ancient Egyptians* (ib., 1908).

NECK (AS *huccca*, OHG. *hnac*, *nac*, Ger. *Nacken*, neck, probably connected with OIr. *cnoc*, OBret. *cnoch*, hill, elevation). The portion of the anatomy between the head and the shoulders. In the human being there are several muscles that pass from the skull to the thorax, which, together with the œsophagus and the trachea, form the principal bulk of the neck. Through the neck run very important blood vessels between the brain and the thorax, among these being the carotid arteries and the jugular veins, accidental cutting of either of which usually causes death very promptly. Through the œsophagus the food passes into the stomach, and through the trachea the air passes into the bronchi and thence into the lungs. The principal muscles of the neck are the platysma myoides, the sternocleidomastoid, the infrahyoid and suprahyoid, the muscles of the tongue, the muscles of the palate and of the pharynx, and the prevertebral muscles, as well as certain of the muscles of the back which are inserted into the skull, as the trachelomastoid, complexus, transversalis cervicis, the rectus group, the longus colli, the three scaleni, and the cervicalis ascendens. Several of these muscles form important triangles with the aid of the ramus of the jaw, the clavicle, the hyoid bone, and the imaginary centre line of the body. These triangles are of use to the surgeon in locating and describing important structures. For instance, the digastric triangle is bounded by the jaw, above, and on either side by a belly of the digastric muscle, attached (at the apex of the triangle) to the hyoid bone below. Within this triangle lie portions of the facial and lingual arteries, and it is the site chosen for ligating the last-named artery.

In man there is present at the back of the neck a rudiment of an important elastic ligament which in some of the lower animals serves to sustain the weight of the head. It is called the ligamentum nuchæ and is a yellow elastic ligament which represents in the neck the supraspinous and interspinous ligaments of the vertebrae of the lower part of the spine. It extends

from the external occipital protuberance to the spinous process of the seventh cervical vertebra. In front and on either side of the trachea lie the two lobes of the thyroid gland. The accessory thyroid glands are in close relation to it, and below, in children, is found the thymus.

NECK'AM, ALEXANDER (1157-1217). An English Latinist, born at St. Albans, Hertfordshire, foster brother of King Richard I. Neckam studied in Paris and in 1180, or before, became a lecturer at the university there. In 1186 he returned to England and later entered an Augustinian monastery at St. Albans, where he did most of his writing. He wrote, on natural science, a prose essay, *De Naturis Rerum*, and *De Laudibus Divine Sapientiæ*, a treatment of the same subject in elegiac verse (both edited by Thomas Wright in the "Rolls Series of Chronicles and Memorials," 1863); also 42 fables. The fables are edited and Neckam's life sketched by Hervieux, *Les fabulistes latins* (3 vols., Paris, 1883-93). The *De Naturis Rerum*, a résumé of the scientific knowledge of the time, deals much with nautical matters, in particular it preserves the earliest European reference to the use of the magnetic needle as a guide to seamen (see page 183 of Wright's edition).

NECKAR, nêk'kär. One of the principal right affluents of the Rhine. It rises in the Swabian Jura in the southwestern part of Württemberg, near the source of the Danube, flows northward through Württemberg, then west through Baden, and enters the Rhine at Mannheim, 30 miles south of the mouth of the Main (Map Germany, C 4). It is 247 miles long and flows for the greater part of its course through a series of lake basins surrounded by vine-clad hills. It is navigable for small steamers to Heilbronn, 71 miles, for smaller vessels to Cannstatt, 116 miles, and for rafts to Rottweil. Heidelberg lies on its banks near its mouth, where the river is flanked by picturesque hills crowned by ruined castles. It is greatly used for floating timber.

NECKER, nâ'kär', JACQUES (1732-1804). A French statesman and financier. He was born Sept. 30, 1732, at Geneva, where his father was professor of public law. In 1747 Necker went to Paris and entered a banking house, where he served his apprenticeship in finance. In 1762 he established a banking business of his own in Paris and acquired a large fortune during the Seven Years' War. After returning from business he became the representative of Geneva at the French court and also a syndic of the French East India Company. He likewise began his career as a writer and in 1773 gained the prize at the French Academy by his *éloge* on Colbert. He acquired a further reputation by his publications on political economy and finance, particularly his *Essai sur la législation et le commerce des grains* (Paris, 1775). On the removal of Turgot from office in June, 1776, Necker was called to assist in financial affairs, and after the brief administration of Clugny he was made Director General of Finances in June, 1777. Necker succeeded in restoring to some degree of order the general financial affairs of the country, though mainly by the perilous expedient of borrowing, which he was enabled to do to an almost unlimited extent, owing to the confidence reposed in his financial dexterity. He reformed and systematized the financial administration, made taxation more

equitable, and restored public confidence in the government. This was the most brilliant period of his life, and the salon of Madame Necker was the rendezvous for all the brilliant literary and political lights of the day. Necker's Protestantism, however, his extraordinary vanity, and some retrenchments which he had made in the royal household, together with his publication on the financial affairs of France, *Compte rendu au roi* (1781), made him an object of great dislike to both Queen and court, and on May 12, 1781, he was suddenly dismissed. He retired to Geneva, and while living in retirement on his estate of Coppet he wrote his famous *Administration des finances*, published in 1784. He returned to Paris in 1787, but was soon banished on account of an attack which he published on the financial policy and management of Calonne. In the financial crises which followed upon the administration of Loménie de Brienne, Louis XVI found himself under the necessity of calling Necker to the office of Director General of Finances and Minister of State. This was in the summer of 1788, and Necker recommended the calling of the States-General and thereby acquired his great popularity. When the court, on June 23, 1789, determined upon nullifying the resolutions of the Third Estate, Necker seemingly objected, and the King dismissed him on July 11 and required him to leave the French dominions. He obeyed, but the disturbances of July 12-14, culminating in the storming of the Bastille, were the result of his dismissal, and the King was under the necessity of recalling him. On the rejection by the Constituent Assembly of his scheme of a loan and the adoption instead of it of Mirabeau's scheme of assignats he resigned his office in September, 1790, and again retired to Coppet, where he died, April 9, 1804. Necker was able and honest, but he was a business man rather than a statesman. His daughter was the celebrated Madame de Staël (q.v.). A complete edition of Necker's writings, edited by his grandson, August de Staël-Holstein, was published in 15 volumes (1820-21). Consult Madame de Staël, *La vie privée de M. Necker* (Paris, 1804), J. F. Nourisson, *Trois révolutions*, *Turgot, Necker et Bailly* (2d ed., ib., 1886), J. Hermann, *Zur Geschichte der Familie Necker* (Berlin, 1886), Charles Gomel, *Les causes financières de la révolution française. les ministères de Turgot et de Necker* (Paris, 1892).

NECKER, SUZANNE, née CURCHOD (1739-94). The wife of Jacques Necker (q.v.), born at Crassier in the Swiss Canton of Vaud. Her father, a Protestant minister, gave her an excellent education. She was at one time engaged to Gibbon, the historian, but after her father's death she went to Paris and there met Necker, then a wealthy banker, who married her in 1764. Under her influence Necker entered public life and became the Finance Minister of Louis XVI. She herself founded a hospital in Paris (1778), which still bears her name, and she wrote a number of books, including *Des inhumations précipitées* (1790), *Réflexions sur le divorce* (1794, new ed., 1881); and five volumes of miscellanies, which appeared after her death (1798, 1802). Consult: G. P. d'Haussonville, *Le salon de Madame Necker* (Paris, 1882; Eng. trans. by H. M. Trollope, 2 vols., London, 1882); D'Arvor, *Madame Necker, 1737-94* (ib., 1897), Mark Gambier-Parry,

Madame Necker, her Family and her Friends (Edinburgh, 1913).

NECKER DE SAUSSURE, de sô'sur', ALBERTINE ADRIENNE (1766-1846). A French writer, born in Geneva. She was the daughter of the naturalist Saussure and married Jacques Necker the botanist and nephew of the French statesman of the same name. Her cousin, Madame de Staël, was credited with the translation (1814) of Schlegel's *Vorlesungen über dramatische Kunst und Litteratur* (1809-11), now known to have been written by Madame Necker herself. The book on which her reputation rests is *L'Education progressive, ou étude sur le cours de la vie* (1828-32), for which the Academy gave her the Montyon prize in 1832. It treats of the importance of child training, in the preparation for later life, and of the education of women. Part of the work was translated by Miss Willard and Miss Phelps (Boston, 1835).

NECKING, NECK MOLDING. The molding or astragal (q.v.) at the junction of the capital and shaft of a column is often called the neck molding, while the plain space between the astragal of the shaft and the echinus in capitals of the Doric (and sometimes of the Ionic) type is called the neck or necking. See COLUMN, ORDERS OF ARCHITECTURE.

NECROMANCY (Lat. *necromantia*, from Gk. νεκρομαντεία, *nekiomanteia*, from νεκρός, *nekros*, corpse + μαντεία, *manteia*, divination). A method of divination by which the dead were supposed to be conjured up and to answer questions concerning the future. Its practice was certainly extremely ancient. It was condemned in the Old Testament. Among the Greeks it was familiar in Homer's day. In historical days necromancy was practiced by priests or consecrated persons at many shrines in Greece. It was also current among the Romans, although banned by the Church under Constantine. It was also employed by the Northern peoples and in the mediæval and later period passed over into sorcery. See DIVINATION; SPIRITUALISM.

NECROPOLIS (Neo-Lat., from Gk. νεκρόπολις, *nekropolis*, cemetery, from νεκρός, *nekros*, corpse + πόλις, *polis*, city). A term originally applied to the cemeteries in the vicinity of ancient cities and in particular to a suburb of Alexandria largely devoted to the reception and embalming of the dead. The term "necropolis" is now, however, used in a much more extended sense and applied to any extensive burial region of ancient date. The most remarkable of these are in Egypt, where they extend for miles along the left bank of the Nile. The pyramids are the most conspicuous features of the Ghizeh necropolis. At Thebes the entire west bank of the Nile was a vast necropolis of the pharaohs, with mortuary temples, endless dwellings for the priests, schools, libraries, etc., the tombs proper being in the neighboring Valley of the Kings. Other famous necropolises in Egypt were at El Kab, Beni Hassan, and Abydos. In Africa the extensive necropolis of Cyrene; in Italy the ancient Etruscan tomb groups of Vulci, Tarquinii, and Capua, distinguished for their painted tombs; the remarkable necropolises of Myra and Antiphellus in Lycia, and that of Petra in Syria are among the important examples belonging to classical antiquity. The extraordinary collection of domed and minareted tombs and sepulchral mosques in Cairo, known as the Karafah (tombs of the caliphs) and

dating from the twelfth to the fifteenth century, is often and justly called a necropolis; but the term is seldom applied to either mediæval or modern cemeteries. The burial places of antiquity have been especially important sources of archaeological discovery, owing to the universal custom in early ages of burying, with the deceased, utensils, arms, money, and jewelry for his use in the nether world. See BURIAL; CEMETERY

NECROSIS (Lat., from Gk. *nekropsis*, *nekros*-*sis*, a killing, deadness, from *nekroun*, *nekroun*, to kill, from *nekros*, *nekros*, corpse). A term employed to denote the absolute death of a circumscribed portion of any tissue. Specifically, in surgery, it is applied to the death of a bone wholly or in part. The dead portion separates from the surrounding healthy tissue by an inflammatory process, the cast-off part being known as the sequester and the boundary between the living and dead tissue as the line of demarcation. Bony necrosis is due usually to direct injuries, inflammations, and infections, which attack either the periosteum (the membrane covering the bone) or the marrow, the immediate cause being interference with the circulation and nutrition. Necrosis of the soft parts is termed gangrene, and the dead portion, known as the slough or sphacelus, separates in the same way as in bone, by a line of demarcation. Necrobiosis is the gradual death of the histological tissue elements, due to imperfect nutrition. It is a much slower process than necrosis. See GANGRENE

NECTAN'EO, or **NECTAN'EBUS**. The name of two kings of Egypt. **NECTANEO I** (Egypt. *Nakht-Hor-hebt*), the *Nektanebēs* (*Nektanebēs*) of Manetho, was the first King of the thirtieth dynasty and reigned from 382 to 364 B.C. The native monuments give little historical information in regard to his reign, but the accounts of Greek writers, especially Diodorus, show that he was a capable and energetic monarch. In the earlier part of his reign he supported Evagoras, King of Cyprus, against the Persians and, when the latter invaded Egypt, succeeded in repelling them, aided by an inundation of the Nile. Nectanebo endeavored to restore the old sanctuaries of the land, and he built or restored temples in many parts of Egypt. His stone sarcophagus, inscribed with religious texts, is in the British Museum. He was succeeded by TEHER or TACHUS, after whom **NECTANEO II** (Egypt. *Nakht-nebo*), the *Nektanebēs* (*Nektanebos*) of Manetho, reigned from 361 to 343 B.C. He was a great builder. For a long time he repulsed the attempts of the Persians to conquer Egypt, but they finally made themselves masters of the delta, and Nectanebo fled to Ethiopia. He was the last native King of Egypt. After his flight Egypt was subject to Persian rule until 332 B.C., when it came into the possession of Alexander the Great. Consult Alfred Wiedemann, *Geschichte Aegyptens von Psammetich I. bis auf Alexander den Grossen* (Leipzig, 1880), and E. A. T. Wallis Budge, *A History of Egypt* (New York, 1902).

NECTAR (Lat., from Gk. *néktar*, *néktar*) In Greek mythology, originally identical with ambrosia (q.v.). From Homer's time, however, nectar is usually the drink of the gods, ambrosia their food, in some later writers nectar is the food and ambrosia the drink of the gods. In the *Iliad* only nectar is mentioned

as the nourishment of the gods; in the *Iliad*, again, both ambrosia and nectar are used as unguents. Consult Roscher, *Nektar und Ambrosia* (Leipzig, 1883), though his identification of ambrosia and nectar with honey is open to grave doubts.

NECTAR. The sweet secretion formed by glands located on various parts of a plant, but especially in the flower. Sometimes it is called honey, but honey is nectar after partial digestion in the crop of insects, such as bees or wasps. See NECTARY, GLAND.

NECTARINE', -rên'. A smooth-skinned variety of the peach. See PEACH, and Colored Plate of DRUPES.

NECTARY. A surface gland which secretes nectar (q.v.). The name is also applied to

FIG. 1. EXTRAFLORAL NECTARY OF THE BRACKEN FERN. a, diagram showing location of gland in the axil of a leaflet, b, section showing the secreting cells beneath a stoma. (After Lloyd)

abortive floral organs (see below). Nectaries are most common in the flowers of seed plants, but are found also in regions remote from the flower (Fig. 1). Extrafloral nectaries are found on the leafstalks and at the base of the leaf blade, upon stipules and other portions of the leaf base, and more rarely upon the blade itself.

The forms of nectaries are very various. The secreting surface frequently covers a more or less pronounced swelling or cushion of tissue, which may develop on the base of the flower leaves or on the axis of the flower between them. Sometimes a nectary stands in the place where in other related flowers well-formed and functional floral organs stand. This fact has led to the application of the term "nectary" to abortive floral organs even when they do not secrete nectar. Sometimes the nectar gland forms a continuous ring about the base of the pistil. In other cases the nectar gland lines the concave surface of depressions in the floral organs or the floral axis. When these pits deepen, they con-

FIG. 2. SEPTAL NECTARY FROM FRUIT OF DAY LILY

The columnar cells lining the tube are the secreting cells

stitute efficient receptacles for the secreted nectar. Thus, spurred petals and sepals are often furnished with nectar glands on the inner side or at the base of the spur, and the whole cavity may become filled with their secretion. Nectar glands sometimes line deep and narrow pits of small capacity, opening at the surface by a pore or cleft from which the nectar oozes. These passages may be branches, so that a complex gland is formed, such as is found in the pistils of some lilies (Fig. 2).

Nectar varies greatly in composition in different plants. The greater part of it is water, which is withdrawn from the gland cells by the osmotic action of the sugar (See SECRETION.) In addition to the sugars glucose and saccharose, various other carbon compounds and small amounts of proteids give the peculiar odor and flavor to the nectar. Nectar is eaten by bees, wasps, butterflies, and other insects, which in their search for it are utilized as unconscious carriers of pollen. See POLLINATION.

NEDBAL, nĕt'bál, OSKAR (1874-). A Bohemian viola player, born at Tabor. He studied at the Prague Conservatory and became a viola player in the Bohemian String Quartet. He composed a *Scherzo-Caprice for Orchestra* and a *Sonata for Piano-forte and Violin*.

NEDHAM, MARCHAMONT. See NEEDHAM, MARCHAMONT.

NEDJED, nĕj'd. A region of Arabia. See NEJD.

NEEDFIRE. In folk custom, a fire kindled by the friction of two sticks of wood or of a rope on a wooden stake to ward off demons of disease. Among the many customs and beliefs connected with fire one of the most important is that of ritual purification. This idea arose at an early stage of man's acquaintance with fire from a simple observation of the effects of flame, the most mysterious phenomenon which he knew. Later fire was differentiated into a number of varieties partly good and partly evil with regard to position and use, thus implying that all flame was not equal in efficacy. Still further it was thought that by age or contamination fire became ineffective and must be renewed, hence the kindling of new fire, which was an accompaniment of widely diffused cults, as that of Thor in Scandinavia and of nature gods in ancient Mexico. The new fire is supposed to regenerate, as fire sacrifice is designed to sustain, the invisible beings. Needfire is a practice usually of shepherd peoples to ward off disease attacking the flocks. In historic times the sparks for kindling the needfire were sometimes obtained by twirling a wooden peg around in a wooden post. As in the case of new fire, the needfire was almost always accompanied with the extinguishing of the fires of the locality, and the neighbors also rekindled their fires from it as in the new fire ceremony. In practice the people passed or the herds were driven through or between the flames of the needfire for purification. The needfire custom survived well into the nineteenth century, and probably traces of it still exist in parts of Europe.

NEEDHAM, nĕd'am. A town in Norfolk Co., Mass., 10 miles southwest of Boston, on the New York, New Haven, and Hartford Railroad (Map Massachusetts, E 3). The most prominent buildings are the town hall and public library. The manufacture of knit goods constitutes the town's chief industry. Pop., 1900, 4016; 1910, 5026.

NEEDHAM, JOHN TURBERVILLE (1713-81). An English naturalist, born in London. He studied at Douai and was ordained to the Roman Catholic priesthood in 1738. Later he became director of the Academy of Maria Theresa at Brussels. Much interested in natural history, he contributed to the *Philosophical Transactions* of the Royal Society of London and was the first English Catholic clergyman to be elected a fellow of this society. His scientific work is of interest at the present time only in so far as it bore on the question of the reality of spontaneous generation. He thought that his experiments demonstrated that living beings may arise spontaneously from lifeless materials. These conclusions are published in his most important works, *Observations upon the General Composition and Decomposition of Animal and Vegetable Substances* (1749) and *Nouvelles observations microscopiques* (1750).

NEEDHAM, or **NEDHAM**, MARCHAMONT (1620-78). An English journalist and pamphleteer, born at Buiford, Oxfordshire. He was educated at All Souls College, Oxford, and after studying medicine and law turned to journalism and founded in 1643 the *Mercurius Britannicus* (sic), to which he was frequently the sole contributor. The boldness of his scurrilous attacks upon Charles I led to his incarceration in the Fleet Prison in 1645 and in 1646, but the following year he became a Royalist himself and began the publication of *Mercurius Pragmaticus*, wherein he defended the King and turned his venomous pen against the Scots and Oliver Cromwell. Afterward he rejoined the popular party, and signalized his conversion by the publication of *The Case of the Commonwealth of England Stated* (1650). He became the editor of *Mercurius Politicus*, a weekly journal in which he again attacked the monarchy. After the Protector's death he went to Holland and continued the publication of his abusive pamphlets, such as *A Short History of the English Rebellion, Completed in Verse* (1661), and *Christianissimus Christianandus; or, Reasons for the Reduction of France to a More Christian State in Europe* (1678).

NEEDLE (AS. *nædl*, Goth. *nēala*, OHG. *nādel*, *nādla*, Ger. *Nadel*, from OHG *nājan*, Ger. *nahen*, to sew, ultimately connected with OIr. *snáthad*, thread, AS *snear*, Eng. *snare*, Lat. *nerc*, Gk. *νέειν*, *nevein*, to sew). An instrument of metal, or other material, used to carry the thread in sewing, embroidering, knitting, netting, and other similar operations. Needles are generally made of metal, but bone, ivory, and wood are also used, for ordinary needlework, called sewing, they are made of fine steel, and are too well known to need description, for other kinds of work they are often much larger and differently formed. The earliest needles were not pierced, but were like awls, and were used for making holes in skins, through which the long roots of plants or leather thongs were passed. Later a hole was bored in one end of the stone or bronze needle, through which the root or thong was passed, and this was dragged through the leather as it was punched. Stone needles with a hole in the end opposite the point are found in the remains of the Stone age. Bone needles with eyes are found in the reindeer caves of France and lake dwellings of central Europe. The needles that have come down to us from ancient Egypt are very coarse, but finer needles must have been made to execute the delicate

NEEDLE-FISH, PIKES, ETC.

1. HALFBEAK (*Hyporhamphus unifasciatus*).
2. SAURY (*Scomberesox saurus*).
3. FLYING FISH (*Exocoëtus volitans*).
4. SHARP-NOSED FLYING FISH (*Fodiator acutus*).
5. NEEDLE-FISH or HOUNDFISH (*Tylosurus acus*).
6. PIKE (*Esox lucius*).
7. POND PICKEREL (*Esox reticulatus*).

embroidery that was produced by that people. The ancient Greeks must have been skilled in needlework, judging from the descriptions of embroidery in Homer. Ordinary needles and surgeons' needles have been found in the ruins of Pompeii.

The Chinese are believed to have been the first to use needles of steel, and these implements gradually found their way westward until they were brought into Europe by the Moors. By 1370 the needle-making industry was established in Nuremberg. In England it was not until the reign of Queen Elizabeth that their manufacture was taken up on any considerable scale in small shops, and after 1650 it gradually developed until the manufacture of hand-sewing needles became an important industry in England, as also later in Germany. Subsequent developments included the introduction of the needle with the eye and the gradual development of machines for their manufacture. In 1785 the first mechanical process for producing the steel rod from which were formed two needles joined together was introduced. The first drill-eyed needles were made in 1826 by using a stamping machine, but it was not until about 1870 that needles were made for the most part mechanically, and not until after 1885 that they were also finished by machine.

The first operation, after the wire has been selected and its thickness accurately gauged, is to cut it into eight-foot lengths, this is done by winding it in a coil of 16 feet circumference and then cutting this coil into exact halves with powerful cutting shears. The coiling of the wire is so managed that there are 100 pieces in each half when cut, the bundles of 100 wires are again cut into the necessary lengths for two needles. The pieces cut from a coil, although now reduced to the length of two small needles, are nevertheless somewhat curved, they are therefore collected into bundles and placed in two iron rings, which hold them loosely together, they are then slightly softened by firing, and are laid on an iron plate or bench, and are pressed with a small curved bar in two or three positions, by which the operator manages to make them all perfectly straight. The blanks after being removed from a hopper in regular succession are next pointed at both ends by a grindstone to whose face they are held by a rubber band.

The eyes are next punched by means of dies. (See DIES AND DIE SINKING.) The blanks or double needles are now placed on two wires and the two sets broken apart to form separate needles. The roughly formed needles still have to be polished, tempered, and have the heads ground into shape, operations which are mechanically performed.

Besides the ordinary sewing needle already described and other hand needles—such as those used in sailmaking, leather work, upholstery, and surgery—many forms of sewing-machine needles are manufactured. The most familiar of these is the needle used in the domestic sewing machine, with the point in the eye and grooves on each side to protect the thread from being worn or cut in passing through the fabric. The latched needles used in stocking machinery are very delicate pieces of mechanism, as the latch is held by a rivet about $\frac{1}{10}$ inch in diameter between walls which are no thicker. For leather-sewing machines the needles must be adapted for use with waxed thread, and often are made with a hook at the end instead of a

hole; while the welting-machine needle, for sewing welts in boots and shoes, is the shape of a segment of a circle.

Needles for use in various machines are made in the United States, especially those for the ordinary domestic sewing machine. At first these needles were made by processes similar to those employed for making ordinary hand-sewing needles, but gradually special machinery has been invented for their manufacture. The process is essentially as follows: The wire is cut into a blank, which is then reduced and pointed, grooved, has its eye punched, is hardened and tempered, hard burr dressed, brass brushed, has its eye polished, undergoes a first inspection, is hard straightened, and then receives the final pointing. In one method of making sewing-machine needles by machinery the crucible-steel wire from which the needle is formed is first straightened and then fed into a machine which makes the large end of the needle and cuts off the blanks of the lengths required. These blanks, after being ground and polished with emery wheels and an emery belt, pass from a hopper on to a grooved endless traveling carrier, where the shank of the needle is formed by the grinding action of an emery wheel. By successive wheels the needles are ground and pointed and then grooves are cut by steel saws and the eyes punched. They are then heated and hardened and cleaned, first by emery and then by wire brushes and burnishing powder applied from a bristle brush. The final pointing is done on a fine emery wheel, and the last polishing is accomplished with crocus and alcohol. A second method differs from that just described in that the steel wire is cut into blanks of about one-third the length of the finished needle. After a thorough cleaning these blanks are fed from a hopper into a machine where they are acted upon by steel dies which compress and extend the blank. This process is known as swaging and produces needles which vary slightly in length. This defect, however, is remedied by the action of a clipping and straightening machine which reduces the needles to a uniform size.

The total value of the various hand-sewing, darning, and shoe-machine needles imported into the United States was as follows: 1903, \$442,887; 1904, \$455,762; 1905, \$406,261; 1906, \$418,816; 1907, \$492,637; 1908, \$414,998; 1909, \$431,147; 1910, \$476,810; 1911, \$445,081; 1912, \$501,033; 1913, \$49,694; 1914, \$481,631. Consult article on "Needles and Pins," in *Twelfth Census of United States*, vol. x, *Manufactures*, part iv (Washington, 1902), and subsequent census bulletins and volumes on manufactures, also articles on the needle industry in *American Machinist*, vol. xxx (New York, 1907).

NEEDLEFISH (so called from the shape of the snout). A garlike fish of the synentognathous family Esocidae, and especially of the genus *Tylosurus*. They are slim, long-jawed voracious, carnivorous fishes, found in all warm seas, and sometimes entering rivers. Their habits are ordinarily much like those of a pike. (See PLATE OF NEEDLEFISH, PIKES, ETC.) Their flesh is good. Some species are numerous on the South Atlantic and Gulf coasts, where they are confounded with the true gars, under the names garfish and billfish (especially *Tylosurus marinus*), and are also called aguja (qv), longjaws, houndfish, and guardfish. Consult Jordan and Fordice, *Proceedings of the United States National Museum for 1886* (Washington, 1887).

NEEDLE GUN. See SMALL ARMS.

NEEDLEWORK. See EMBROIDERY.

NEEF, nâf, or **NEEFS**, nâfs, PIETER, the Elder (c.1578-c.1661). A Dutch architectural painter. He was born at Antwerp and was there a pupil of Hendrick van Steenwyck. His numerous architectural paintings usually represent church interiors, frequently illuminated with the glow of torches or of candles. His treatment was delicate and refined, his knowledge of perspective extraordinarily accurate. Moreover, he understood the harmonious modulation of colors and the power of chiaroscuro, but he generally intrusted the painting of the figures introduced into his pictures to Teniers, Breughel, Van Thulden, Frans Francken, and others. His works are to be found in the galleries of Dresden, Vienna, Paris, Amsterdam, the Metropolitan Museum and the Historical Society, New York, and elsewhere. His son, Pieter the Younger (1620-75), painted similar subjects, and their works are frequently confounded.

NEELE, nêl, HENRY (1798-1828). An English writer, born in London. He was admitted to the bar and practiced as a solicitor. From the successful appearance of his *Odes and Other Poems* (1817), printed during his clerkship, he was a busy contributor to various journals and the annuals. In 1827 he gave, first at the Russell Institution and later at the Western Literary Institution, his *Lectures on English Poetry*, extending from Chaucer to Cowper. His most important publication was the *Romance of English History* (3 vols., 1827), a collection of stories based on occurrences in each reign from the Conquest to the Reformation, marred by a stilted style and historical inaccuracies. In the same year his poems were gathered in a two-volume edition. His verse has no higher qualities than spontaneity and ease. His stories, at their best, are marked by considerable imaginative skill. His *Literary Remains*, including the *Lectures*, appeared posthumously (1829), with a memoir. The *Winter Nights* (London, 1820) of Nathan Drake contains (no. xiii, vol. II) "Critical Observations" on the *Odes and Other Poems*, associating Neele with Chatterton and Kirke White. At 30 he cut short his career by suicide.

NEENAH, nē'na. A city in Winnebago Co., Wis., 13 miles north of Oshkosh, the county seat, on the Fox River, at the outlet of Lake Winnebago, and on the Chicago and Northwestern, the Chicago, Milwaukee, and St. Paul, and the Minneapolis, St. Paul, and Sault Ste. Marie railroads (Map: Wisconsin, E 4). It is an attractive summer resort, well known for its fishing, and has a public library, the Kimberly High School, Theda Clark Memorial Hospital, a handsome opera house, and several public parks, the most notable being Riverside Park. The river, which affords fine water power, divides, as it leaves the lake, into two streams, inclosing a large island, half of which belongs to Neenah and half to Menasha, the two cities forming practically one industrial community. Manufacturing enterprises are well developed and include paper, lumber, and flour mills, woodworking plants, knitting mills, creameries, stove works, foundries and machine shops, brickworks, a boot and shoe factory, etc. Large quantities of cheese and butter are shipped from Neenah. Settled in 1840, Neenah was incorporated in 1850 as a village, and in 1873 was chartered as a city. The government, under a charter of 1883, is administered by a mayor, chosen every two years, and

a unicameral council. The municipality owns and operates the water works. Pop., 1900, 5954; 1910, 5734.

NEER, nâr, AART VAN DER (1603-77). A Dutch landscape painter, the father of Eglon Hendrik van der Neer, born at Gorcum. He was a tavern keeper as well as a painter, and is thought to have studied under Camphuysen. His paintings frequently resemble those of his friend Albert Cuyp—for the most part moonlight scenes, depicted with a delicate warm tone. At times he represented the same scenes, usually towns or groups of cottages on the banks of a canal or river, in winter or at sunset in other seasons. Fine specimens of the latter kind are in the National Gallery, London, in the Hermitage, St. Petersburg, and in the Metropolitan Museum, New York, which also possesses a good night scene, "The Farrier." Van der Neer likewise painted remarkable conflagration effects, good examples of which are in the Schwerin Gallery and the Berlin Museum, which, besides a winter and a sunset scene, contains four effective moonlight pieces. Among the best of the latter variety are one in the Arenberg Gallery, Brussels, two in the Dresden Gallery, and several in the Wallace collection, London, which owns, besides, two of his finest winter landscapes. These may also be seen to advantage in the museums of Amsterdam and Brunswick and the collection of Lady Wintage. Van der Neer died at Amsterdam, Nov. 9, 1677.

NEER, EGLON HENDRIK VAN DER (1634-1703). A Dutch genre and landscape painter, born at Amsterdam. He was at first instructed by his father, Aart van der Neer, who, on his showing preference for figure painting, placed him under Jakob van Loo. At the age of 20 he went to France, where he spent about three years, then lived successively in Rotterdam, Amsterdam, and Brussels, and in 1690 became court painter to the Elector Palatine at Düsseldorf, where he died on May 3, 1703. His favorite subjects were interiors, the best being single figures, especially ladies in elegant attire, engaged in domestic occupations, in the manner of Terborch and Metsu. He is, however, inferior to these masters in technique, freedom of composition, and rendering of textures. Good examples of this kind are a "Lady Tuning her Lute" (1678), in the Pinakothek at Munich and similar subjects in the Rotterdam Museum (1669) and in the galleries at Karlsruhe (1677) and Dresden. Eglon van der Neer was also fond of heroic landscapes with biblical or mythological figures modeled after Elsheimer, such as "Tobias with the Angel," in the Amsterdam, Berlin, and Karlsruhe museums. His portraits are frequently mistaken for those of Kaspar Netscher.

NEERWINDEN, nâr'win'den. A village of Belgium, in the Province of Liège, 5 miles southeast of Trillemont, celebrated in history for the great victory gained by the French under the Duke of Luxembourg over the English and Dutch under William III (July 29, 1693). (Map: Belgium, D 4.) It was also the scene of the defeat of the French under Dumouriez by the allies under the Prince of Coburg (March 18, 1793). It was occupied by the Germans in the European War which began in 1914.

NEES VON ESENBECK, nês fôn 'a'zen-bêk, CHRISTIAN GOTTFRIED (1776-1858). A German botanist and naturalist. He was born at Erbach in the Odenwald, studied medicine at Jena, and in 1818 became professor of botany at the Uni-

versity of Erlangen. He subsequently was professor of botany at Bonn, and in 1830 accepted the posts of professor of botany and director of the botanic garden at Breslau. In 1848 he went to Berlin and took an active interest in the agitations of that and the following year. His deposition from the chair of botany in 1852 was the consequence of his political activity. In his *Handbook of Botany* (1821) he developed the theory advanced by Goethe in his *Metamorphose der Pflanzen*, that all the parts of the flower are only variations of the leaf. This work had been preceded by *Die Algen des süssen Wassers* (1814); by *Das System der Palze und Schwämme* (1816); and by *Substanz der Pflanzen* (1819), in which he was assisted by Rothe and Bischof. He published, in 1833, *Genera et Species Astereorum*; in 1836, *Systema Laurinarum*, and in 1841, *Flora Africæ Australiaris Illustrationes Monographice*. In 1852 appeared the first volume of *Die allgemeine Formenlehre der Natur*. He was a specialist on cryptogamous plants, and in this branch of botany his chief work is *Naturgeschichte der europäischen Lebermoose* (1833-38).

NE EX'EAT (Lat., let him not go out). A writ or order issued by a court of equity, directed to a sheriff and commanding him to arrest the defendant in an action and detain him until he furnishes a certain bail, on condition that he will not leave the jurisdiction without permission of the court. About the time of Queen Elizabeth this writ came to be employed by the Court of Chancery to restrain a person who was under some equitable obligation to another from leaving the country. This practice became common in England, and was adopted into equity or chancery practice in the United States, where it still obtains in many States.

This equitable remedy of *ne exeat* corresponds in its purposes to the legal process of arrest and bail in civil cases, and has been abolished by some modern codes of procedure, as in New York, and the legal remedy substituted in its stead. See **ARREST**, **BAIL**; **EQUITY**. Consult the authorities referred to under **EQUITY**, **PROCEDURE**, **WRIT**.

NEF, JOHN ULRIC (1862-1915). An American chemist, born at Herisau (Appenzell), Switzerland. He graduated at Harvard University in 1884, held a fellowship there in 1884-87, studied also at Munich (Ph.D., 1886), and in 1887-89 was professor of chemistry in Purdue University (Lafayette, Ind.). In 1889-92 he was assistant professor of chemistry and acting director of the chemical laboratory in Clark University (Worcester, Mass.), in 1892-96 was professor of chemistry in the University of Chicago, and in 1896 became head of the department of chemistry in that institution. He is known internationally as an original worker in organic chemistry. Among his contributions to this science may be mentioned his establishment of the constitution of fulminic acid and his theory that in many compounds and reactions carbon acts as a bivalent element. In 1915 the honorary degree of doctor of laws was conferred upon him by the University of Pittsburgh. His scientific papers were published in the *Annalen der Chemie*.

NEGAPATAM, nêg'a-pa-tâm'. A seaport city on the Coromandel coast, in the district of Tanjore, Madras, British India, and the terminus of a branch line from Tanjore, 48 miles east of that town (Map: India, D 7). It has

regular steamer communication with Ceylon, Burma, and the Straits Settlements, and carries on an active trade exporting rice, tobacco, cigars, hides, and paddy, and importing cotton goods, betel nuts, and camphor. The extraction of oil from coconuts and oil seeds is an important industry. The extensive construction and repair plant of the South Indian Railway is located here. Negapatam was one of the earliest Portuguese settlements on the Coromandel coast; it was taken by the Dutch in 1660, and was the capital of their Indian possessions until captured by the English in 1781. Pop., 1901, 57,190; 1911, 60,168.

NEGATIVE (from Lat. *negativus*, negative, from *negare*, to deny, from *neq*, not + *acere*, Skt. *ah*, to say, Gk. *ἔμει*, I say). A photographic picture in which the lights and shades of the object are reversed. A negative is usually produced in a camera by the action of light upon the sensitized surface of a glass plate, celluloid film, or paper. (See **PHOTOGRAPHY**.) When the plate or film is developed, the portions most affected by the light receive the densest deposits and are rendered nearly if not quite opaque, while the portions corresponding to the shadows appear transparent. A good negative should show the gradations of light and shade and should be distinct in all its detail. The presence of as many tones, or values of light and shade, as possible is desired, while at the same time the high lights and shadows must be marked. The production of a good negative, outside of questions of the preparation of the plate or film, depends chiefly upon a proper length of exposure and successful development. A negative is used for making positives by contact printing or with an enlarging or copying camera. For contact printing the negative is placed film side upward in a printing frame, and on it is laid a sheet of sensitized paper with its coating next to the film. The printing frame is then exposed to the light, and the rays passing through the clear or transparent portions of the negative affect the paper beneath, while those portions beneath the dark or opaque parts of the negative are protected and remain white. In this way a large number of positives or correct reproductions can be obtained from one negative.

NEGATIVE HELIOTROPISM. See **APHYLLOTROPISM**.

NEGATIVE HYDROTROPISM. See **APHYDROTROPISM**.

NEGATIVE QUANTITY. The inverse operations of mathematics, such as subtraction, division, and evolution, often lead to results which cannot be expressed in terms of the same unit as the numbers entering the operation. The interpretation of these results leads to the so-called artificial numbers and in the particular case of subtraction to the notion of negative number. For example, \$2 - \$3 is impossible if the result is to be expressed in terms of the positive unit \$1, but, since the result of subtraction is the number which added to the subtrahend will produce the minuend, it is easy to see that the number which added to \$3 will make \$2 must be equivalent to the number which subtracted from \$3 will make \$2. In other words, instead of subtracting \$1 from \$3 to reduce it to \$2, a number must be added which will produce the same result. Such a number is called

a negative number and is designated by the sign $-$ placed before it. Hence $\$2 - \$3 = -\$1$. This notion of negative number as the opposite of positive number, and apparently growing out of an arbitrary interpretation of a mathematical process, has its counterpart in concrete magnitudes opposed in function or extent. For example, in the above case, if a man's assets are $\$2$ and his debts $\$3$, the number expressing his financial status is $\$1$ of indebtedness, which may be expressed by $-\$1$. Similarly, time A.D. is often expressed by positive numbers and time B.C. by negative numbers. In astronomy north latitude is expressed by positive numbers and south latitude by negative numbers; west longitude may be designated as positive and east longitude as negative, or vice versa. Such extensions of the meaning of signs and modes of operation are the natural outgrowths of a constantly progressive science. The introduction of the negative number doubles the number space of arithmetic by adding an infinite series of numbers opposite in meaning and having a 1 to 1 correspondence (see CORRESPONDENCE) with the series of positive numbers.

The negative quantity enters geometry through the phases of motion and direction. For example, the segments AB , BC , and CD of a horizontal straight line AD thought of as extending to the right are considered positive, but the segments DC , CB , and BA thought of as extending to the left are considered negative. Similarly, many writers regard all angles generated by a line revolving counterclockwise about a point as positive and those generated by a clockwise motion as negative. The introduction of negative quantities into geometry, especially in connection with the theory of continuity (see CONTINUITY), has greatly increased the power and scope of the subject.

The meaning of negative quantities as employed in the physical sciences may be illustrated from elementary mechanics. A material point confined to a horizontal straight line may move to the right, remain stationary, or move to the left. The first condition may be expressed by a positive velocity towards the right, the second by a zero velocity, and the third by a negative velocity.

By analogy to mathematical usage the positive and negative notation is sometimes applied to quantities measured by scales like those of the ordinary thermometers, on which an arbitrary point is denoted as the zero point, and all degrees below zero are denoted by negative numbers. Such conventional notations are convenient, but not always well founded. Thus, the temperature -1°C is not the physical opposite of $+1^\circ \text{C}$, the two temperatures would be the physical opposites of each other only if 0°C represented a state in which bodies would have no heat at all, and if it were possible that a body should have less than no heat. On the other hand, in the case of physical magnitudes whose character, like that of electricity, may be dual, the positive and negative notation has again a definite natural meaning.

Negative quantities have been thoroughly understood only within recent times. Although Hero of Alexandria in his *Stereometria* considered the expression $\sqrt{81} - 144$ as possible, the result is recorded as $8 - 1/16$, which shows that neither negative nor imaginary quantities were understood by the Greeks. Diophantus (c.275), however, recognized the difficulty, for

he describes the equation $4 = 4x + 20$ as *átrōtos* (absurd), because the root could not be a natural number or a fraction. The Hindus were more successful, for Aryabhatta (c.530) distinguished between *dhana* (assets), positive quantities, and *kshaya* (liabilities), negative numbers. Bhaskara (c.1150) was aware that a square root can be both positive and negative, and that $\sqrt{-a}$ does not exist for the ordinary number system. Al Khuwarizmi (c.830), a celebrated mathematician under the Arab supremacy, obtained two roots for the quadratic equation, but the negative roots were rejected as not valid. Among the early European mathematicians Fibonacci (1202) went no further than the Arabs. Paccioli (1494) definitely stated the rule, *minus times minus alicuius gives plus*, but this fact was known to the Arabs and Hindus—Bhaskara, e.g., having stated that the square of a negative number is always positive. Cardan (1545) recognized negative roots, but called them *astimaciones falsae* or *fieta*. Stifel (1544) called negative numbers *numeri absurdi*, and Harriot (1631) was the first to consider such a number capable of forming a member of an equation. Vieta (1591) distinguished between positive and negative numbers, and Descartes (1637) in his geometry used the same letter for both positive and negative quantities.

NEGAUNEE, ne-ga'né. A city in Marquette Co., Mich., 3 miles east of Ishpeming, on the Chicago and Northwestern, the Duluth, South Shore, and Atlantic, and the Lake Superior and Ishpeming railroads (Map Michigan, B 2). It is in the great iron region of the State, on a ridge called the Iron Mountain, at an elevation of about 1400 feet, and has several productive iron mines within the municipal limits. It was at Negaunee that the first discovery of iron ore in the Lake Superior region was made. Negaunee's existence as a community dates from 1846, it was incorporated as a village in 1865 and as a city in 1873, the charter of that year, as revised, now operating to provide for a mayor, annually elected, and a unicameral council. The water works and electric-light plant are owned and operated by the city. Pop., 1900, 6935, 1910, 8460, 1914 (U.S. est.), 9108.

NE'GEB (Heb., Egypt *Ngb*, possibly connected with an Aram. root *ngab*, to be dry, hence dry land, steppe). The name of a region in southern Palestine between the Arabah (q.v.) and the Mediterranean littoral and extending approximately from Hebron and Gaza in the north to a line running through Wadi Kades towards El Arish. As "towards Negeb" often is employed to indicate a southerly direction, it is translated "south" or "southland" in the English version, but the term Negeb should be used to avoid confusion. The earliest-known inhabitants of this district seem to have been Horites and Canaanites. The Hyksos movement is likely to have driven many ethnic elements into this territory, among them Hittite clans. The land of Negeb seems to be mentioned in an Egyptian inscription from the time of Thothmes III (1501-1447 B.C.). After the expulsion of the Hyksos from Egypt (c.1575 B.C.) Levi and Simeon appear to have occupied the centre of Negeb. Kadesh Barnea, the home of Moses (q.v.) and Miriam (q.v.), was at one time the chief city of the Levites. Beersheba, Bethuel (modern Halaza), Zephath (modern Meshrefe), and Ziklag (modern Asluj) are mentioned as Simeonite cities. Levi and Simeon, however,

were overthrown and scattered, probably by the Idumean Jerahmeelites first and then, after 1200 B.C., on the west by the Cherethites (Creteans). In the time of David (c. 1033-993) there were five distinct parts of the Negeb, viz., the Negeb of Judah, the Negeb of the Jerahmeelites, the Negeb of the Kenites (1 Sam. xxvii. 10), the Negeb of the Cherethites, and the Negeb of Caleb (1 Sam. xxx. 14). The Kenites dwelt farthest east near the Dead Sea and the Arabah, the Calebites lived in Hebron and its neighborhood; the tribe of Judah evidently held some places in the north, the Jerahmeelites had their cities in the centre, west of them Creteans and Philistines occupied a part of the Negeb, and the Amalekites were in possession of some places in the south and made raids so far as Ziklag. During the period of the Judean Kingdom the various tribal elements were merged. After the exile the Edomites, driven out of Mount Seir by the Nabateans, settled in the Negeb. Accustomed to city life, they no doubt developed those towns they took over from the Jews. The most flourishing period in the history of the Negeb seems to have been the time of the great Byzantine cities, whose ruins are still standing at Ruhaibeh, Sebaita, Meshrefeh, Saidiveh, El Abdeh, El Aujeh, and Halaza. The dated Greek inscriptions found in a cemetery at Ruhaibeh and published by Schmidt and Charles in 1910 come from the fifth, sixth, and seventh centuries A.D. Greek civilization and Roman statecraft had made the desert places blossom like a garden, covered the valleys with grain and the terraced hills with vines, caused cities to grow, with beautiful streets and squares and walls, with temples and theatres, basilicas and churches, baths and aqueducts, and filled the land with a large and thrifty population. After the Arab conquest the cities declined and finally fell into ruins and became again a steppe land. It has been visited in recent times by some explorers, but has not yet been scientifically surveyed.

NEGELEIN, nā'ge-lin, JULIUS VON (1872-) A German Oriental philologist, born at Königsberg. He was educated at the Gymnasium of Königsberg and at the universities of Greifswald, Berlin, Königsberg, and Marburg. After 1899 he was privatdozent at the University of Königsberg. Besides numerous contributions to learned reviews he published: *Das Verbalssystem des Atharvaveda* (1897); *Germanische Mythologie* (1906, 2d ed., 1912); *The Paraśiṣṭas of the Atharvaveda* (3 parts, 1909-10); with Bolling, *Der Traumschlüssel der Jagaddera* (1912); *Atharvaprāyaścittāni* (1913-14).

NEGLIGENCE (Lat. *negligentia*, from *negligens*, pres.p. of *negligere*, *neglegere*, to neglect, from *neg*, not + *legere*, to gather). The omission to do something which a reasonable man guided by those considerations which ordinarily regulate the conduct of human affairs

would do, or the doing something which such a prudent and reasonable man would not do. This definition assumes that the thing omitted or done was in violation of a legal duty, and resulted in legal damage to the one to whom the duty was owed. The three elements of negligence considered, then, are: (1) proper care; (2) legal duty, (3) legal injury.

1. It will be observed that the standard of care required by the definition is such as a reasonable man would exercise in a given situation. Whether such care has in fact been taken or not is generally a question of fact for the jury trying the question. It is true that if the evidence is not conflicting—if the story of the plaintiff is the same as that of the defendant, and if, in the opinion of the court, reasonable men could draw but one inference from the evidence—the question of negligence will be decided by the court. Hence a court often nonsuits a plaintiff on the ground that his own evidence shows that the harm of which he complains was not caused by any negligent act or omission of the defendant. As a rule, however, the jury are to determine whether the defendant's conduct was reasonably prudent or not. At the same time, the court is bound to explain to the jury the legal rules bearing upon the subject, of which the most important are these:

When a person undertakes the performance of a task which requires special skill, the failure to do all that any skillful person could reasonably be expected to do in such a case, considering all the circumstances, will amount to actionable negligence. If an ordinary mechanic undertakes to clean or repair a watch, he is bound to do the work with the skill and care of the ordinary watch cleaner or repairer.

The law does not presume negligence on the part of any one, and throws upon him who alleges that another has been negligent the burden of proving the fact. Accordingly, a person who has been injured by a runaway horse, or whose property has been destroyed by a fire which started on his neighbor's land, must show, not only that the horse ran away or the fire started, but that it was through the owner's fault. At times, however, the situation of the parties when injury occurs is such as to overcome the ordinary presumption of care on the part of the defendant. To such a situation the maxim is applied, *res ipsa loquitur*—"the thing speaks for itself." A railroad train jumps the tracks, a case of goods falls out of a warehouse window, or a peck of live cinders is thrown out of a railroad engine of an elevated road upon a traveler in the street below, in each case we have a situation which would not exist, ordinarily, had the railroad company or the warehouseman exercised ordinary care. Hence the presumption of due care on his part is overcome, and judgment will pass against him unless he can show that, notwithstanding these appearances, he was really without fault.

Another important rule is that the amount of care required varies with the apparent risk. One sets fire to brush or rubbish upon his premises and the fire spreads to his neighbor's land, doing damage and hurting another. Whether he acted negligently will depend upon various circumstances, such as these: Was the weather dry or damp? From what direction and with what velocity was the wind blowing? What

vigilance and effort did he exercise in trying to keep the fire on his own land? Again, without warning, one throws an article from a scaffold to the ground, hitting and hurting another. Whether he acted negligently will depend upon the apparent risk incident to the act. If the scaffold was adjoining a city street and the article was thrown into the thoroughfare, the act would be clearly negligent. On the other hand, if the scaffold overhung private premises, and there was no reason to believe that other persons were present, the act might well have been a reasonable one.

In some cases the courts are disposed to hold persons liable for harm caused by their acts or omissions, whether these are negligent or not. The doctrine was laid down by an eminent English judge as follows: "The person who for his own purpose brings on his land, and collects and keeps there, anything liable to do mischief if it escapes, must keep it at his peril, and, if he does not do so, is *prima facie* answerable for all the damage which is the natural consequence of its escape. He can excuse himself by showing that the escape was owing to the plaintiff's default, or was the consequence of the act of God." This view has not generally been adopted in the United States, the courts preferring the rule that one who brings dangerous agencies upon his land or under his control is not an insurer of the safety of others, but that he is bound to exercise a care over them commensurate with the apparent risk in each case.

The terms "gross negligence," "ordinary negligence," and "slight negligence" are often used, although the modern tendency is to discard them. When employed, the first represents the extreme of negligence—a want of care amounting almost to recklessness; the second is the absence of such care as an ordinarily prudent man exercises, and the third stands for the lack of care required of one who is doing a favor to the injured party, such as keeping his property gratuitously.

2 The legal duty of exercising care is relative, not absolute, when no duty to exercise care exists, there can be no such thing as negligence in the legal sense of the term. In other words, a man may be very careless without being negligent. To illustrate the owner of a sugar orchard left a bucket of hot maple syrup uncovered in his woods. A neighbor's unruly cow jumped the fence, wandered into the wood lot, and died from drinking the sirup. Leaving the sirup thus was careless so far as protecting it from harm was concerned, but it was not negligence towards the owner of the cow, for the owner of the sirup was under no legal duty to exercise ordinary care towards trespassers, and the act of the cow was a trespass (q.v.). Towards trespassers the duty of a landowner, a common carrier, or the like, is simply to refrain from inflicting willful or wanton injury. Towards a licensee, i.e., one whom a person permits to be upon his premises or in his vehicle, the licensor owes some duty of care; but the amount of care is slight. As a rule, the licensee takes the risk of the situation. There must be something like fraud on the part of the licensor before he can be held answerable for injuries sustained by the licensee in falling into unguarded excavations, or breaking through defective floors, staircases, pavements, or the like, or getting caught by

unfenced machinery, or being thrown from a collapsing carriage. The licensor is bound, however, not to open new excavations in or near a path which he knows licensees are accustomed to traverse, or to subject them to anything like mantraps or new and serious dangers without giving them warning. An ordinary guest is generally looked upon by the law as a mere licensee. Towards persons expressly or impliedly invited upon one's property in a matter of common interest, the inviter is under a well-defined duty—the duty of making the property reasonably safe. He is not under an absolute duty to prevent harm, but only to make the place as little dangerous as such a place would reasonably be, having regard to the ordinary exigencies of the business there carried on.

3 Even when it is shown that the defendant has been guilty of negligence towards the plaintiff, the latter may fail in his action because he cannot show that he has sustained legal harm by such negligence. A striking illustration of this rule is afforded where one is made sick by a nervous shock due to another's negligence. Through the fault of a railroad company, e.g., a car takes fire, and several passengers are so badly frightened that they faint and for weeks are confined to their beds by consequent sickness. According to the prevailing doctrine in England and in the United States, they have no cause of action against the company. Various reasons are assigned in its support. One is that such sickness is not the natural and probable consequence of the negligence, that it occurs only when there is an accidental or unusual combination of circumstances which could not have been reasonably anticipated by the defendant, and over which he had no control. Another reason urged is that to hold a defendant liable for mental anguish, or fright, or nervous shock, would cause an alarming increase in the volume of sham litigations. Every passenger in case of a railroad collision could allege fright or nervous shock and thus maintain an action against the company. In a few jurisdictions, however, mental anguish, even without consequent or attendant physical injury, is deemed legal damage. It is generally held that if the defendant's negligence causes injury to one's body, recovery may be had for the pain and suffering incident thereto.

Not only must the harm sustained by the plaintiff be of a character which the law deems it wise to recompense, but it must be, in contemplation of law, the natural and probable consequence of defendant's negligence. When negligence is to be deemed the proximate cause, and when the remote cause, is often a question of great difficulty. When the inquiry is sent to a jury, they are generally instructed that the proper test to be applied by them is. Was there an unbroken connection between the negligence and the injury? Did the facts constitute a continuous succession of events so linked together as to make a natural whole, or was there some new and independent cause intervening between the wrong and the injury? Applying this test, the plaintiff was beaten in the following case. Defendant, a railroad company, received a quantity of wool for transportation from Buffalo to Albany, N. Y., and for delivery there to another company for transportation to Boston, Mass. It was negligent in starting the wool on its journey, so that it

reached Albany 10 days later than it would but for such negligence. While in defendant's warehouse awaiting the call of the second carrier the wool was injured by an extraordinary flood. It was held that the immediate and proximate cause of plaintiff's loss was the flood, and that defendant's negligence was too remote to render it liable. The latter had ceased to operate as an active or efficient cause before the flood came.

It is on this ground (that defendant's negligence is not the proximate and efficient cause of one's injury) that the injured party is denied a recovery when he is shown to have been guilty of contributory negligence. A single example will suffice here. A workman is warned by his employer not to work upon a scaffold at a certain point because it has no railing there. He does work on that part and, forgetting the absence of a rail, steps backward, falls, and is injured. Clearly it is the workman's negligence, not the employer's, that is the decisive cause of his harm. But suppose, being there with knowledge of defendant's negligent omission of a railing, he had been knocked from the scaffold by the fall of an object from the roof, which fall was due to defendant's negligence. The servant's presence at the point in question would have furnished an opportunity for defendant's negligence to operate, but would not have been the cause of his injury, and he would recover.

Negligence which is the proximate and efficient cause of the death of a human being may subject one to a criminal prosecution for manslaughter, but at common law it does not render one liable in tort. The latter rule has been changed by statute both in England and in many of the United States. While this legislation varies in different jurisdictions, its principal object is to grant a cause of action on behalf of those who were dependent upon or financially interested in the life of the deceased against the one wrongfully causing his death. Consult *Shearman and Redfield, Treatise on the Law of Negligence* (5th ed., New York, 1898), Pollock, *The Law of Torts* (7th ed., ib., 1904), E. B. Thomas, *Negligence* (2d ed., ib., 1904), S. D. Thompson, *Commentaries on Negligence* (7 vols., Indianapolis, 1905-07), Thomas Beven, *Negligence in Law* (3d ed., Toronto, 1908). See CAMPBELL'S (LORD) ACT; TORT.

NEGOTIABLE INSTRUMENTS (ML *negotiabilis*, from Lat. *negotari*, to negotiate, from *negotum*, business, from *neg*, not + *otum*, leisure). Contracts in writing which are transferable by indorsement or delivery, and which are enforceable by the transferee in his own name, without previous notice to the promisor, as well as without the risk of being met by defenses that would have been good against the transferor. Such contracts were unknown to the early common law of England. By that law a contract, whether written or oral, could not be transferred so as to enable the transferee to sue upon it in his own name. He was obliged to sue in the name of the transferor. Equity modified this rule to the extent of allowing an assignee of a contract to sue in his own name. But, even in equity, the assignment would not bind the promisor until he received notice of it, and after notice he could set up all defenses against the assignee which were available to him against the assignor at the time of notice. In other words, the assignee could get no better

title than the assignor had. Modern statutes have made nearly all contracts of action assignable; i.e., they permit the assignee to sue upon them in his own name, but he takes them subject to the defenses available against his assignor.

The negotiability of certain contracts is a characteristic impressed upon them by the usages of merchants. This quality was first recognized and made effective by the law merchant (q.v.), whose rules were later adopted and enforced by the common law. Thus it has come about that for more than three centuries certain contracts in writing have been treated by all English judicial tribunals as negotiable, in contrast with others which are only assignable. The earliest form of negotiable instrument recognized by English law was the foreign bill of exchange (q.v.). Next in order came the domestic or inland bill of exchange, differing from the foreign bill only in the fact that it was drawn and payable within the same state or political jurisdiction. Following this came the promissory note (q.v.), but its negotiable character was not established without a struggle. It is true that the negotiability of this novel mercantile instrument passed unchallenged for a time in England, but after Lord Holt became Chief Justice he set his face against the recognition of new forms of negotiable instruments and decided that promissory notes were not negotiable. Immediately the merchants of London appealed to Parliament, which thereupon enacted a statute upholding the mercantile view and declaring promissory notes negotiable like bills of exchange (3 and 4 Anne, c. 9, 1704). About this time another species of negotiable instruments was devised and came into general use—the goldsmiths' or bankers' notes. These were the promissory notes of bankers, payable to bearer on demand, and originally given for money actually deposited with the maker by the one to whom they were issued. Lord Mansfield had no hesitation in treating them as negotiable by delivery. A little later the use of checks (see CHECK) became general. For some time the legal status of this instrument was doubtful, but it has long been recognized as a species of bill of exchange, and is now authoritatively defined as a bill of exchange drawn on a bank and payable on demand.

The foregoing are the most common forms of negotiable paper, but several other forms have been found useful in mercantile transactions and have received judicial approval, such as the bonds of business and municipal corporations, exchequer bills, and scrip for government bonds. In order that a written contract may possess negotiability, it must be payable to order or to bearer and must be treated in the money market as a security for and representative of money. Accordingly, bills of lading (see BILL OF LADING), warehouse receipts (see WAREHOUSE RECEIPT), and like documents of title are not negotiable instruments, even in jurisdictions where they are declared by statute to be negotiable. They are not representatives of money and cannot perform the functions of currency. They are symbols of goods, and their transferee gets no better title to the goods which they symbolize than he would secure by the delivery of the goods. Hence the thief or the finder of a bill of lading cannot pass a perfect title to a bona fide purchaser thereof, as he can do in case of a bill of exchange or a promissory note,

The right to enforce negotiable paper free from defenses available against the transferor or prior parties is confined to the bona fide holder, i. e., to one who has become the owner of the paper before it is due, for value, and without notice of any defect in the transferor's title. Such a holder can pass his title even after the paper is due, and to one who has notice of defects in the title of one back of such holder.

The law of negotiable instruments has been codified in Great Britain (Bills of Exchange Act, 1882, 45 and 46 Vict., c. 61) and in most of the United States.

NEGOTIABLE PAPER. See NEGOTIABLE INSTRUMENTS

NEGRI, nã'grè, ADA (1870-). An Italian poet, born at Lodi of a family of artisans. As a teacher in a village school, she wrote her first verses, which passed almost unnoticed in the columns of a periodical, but they attracted attention to her when published as the volume of lyrics entitled *Fatalità* (1893), which had a wide sale in Italy and was translated into German. A second volume, the *Tempeste*, appeared in 1896. Soon after the publication of the *Fatalità* she received a post in the normal school at Milan, where she married the manufacturer Garlanda. Her third collection of poems, *Maternità*, appeared in 1904. Ada Negri sings the song of the submerged classes. Her earlier verses have a Lombard fierceness of revolt lacking in her later writings. She depicts in vivid colors the abject misery of the workman engaged in a constant struggle against the cruel aristocrat, the ignoble bourgeois, and hostile nature. Although she idealizes the figure of the peasant or the artisan and is careless of form, her verse is characterized by spontaneity and sincere feeling. Consult Guido Mazzoni, in the *Nuova antologia* (Rome, 1893), and Jean Dornis, *La poésie italienne contemporaine* (Paris, 1898).

NEGRI, CRISTOFORO (1809-96). An Italian politician, historian, and geographer, born at Milan. He became professor at Padua in 1843, was the first member of the faculty to side with the Italian cause in 1848, and after Custozza and the success of Austria he was forced to resign his chair. He was almost immediately elected president of the University of Turin, and held a place in Gioberti's ministry until the battle of Novara. He then became chief of the consular service and held this position under Azeglio, Rattazzi, and Cavour. In 1867 Negri founded the Italian Geographical Society, and was its president for five years. He wrote: *La grandezza italiana* (1864); *La storia politica dell' antichità paragonata alla moderna* (1867); *I passati viaggi antartici e l' ideata spedizione italiana* (1880).

NEGRITOS, nã-grē'tōz (Sp., little negro). The term applied by most modern ethnologists to one of the great ethnic groups into which the

population of the East Indies is divided. Some anthropologists recognize a Negritic stock consisting of three groups, Negrito, Papuan, and Melanesian, while others regard the Indo-Oceanic Negritos as a separate branch of the *Homo æthiopicus*, distinct from the Indo-Oceanic Negroes, from whom they believe that the Papuans and Melanesians have sprung. It seems best, however, to count the Malays, Indonesians, Negritos, and Papuans as the four ethnic stocks of Malaysia. The term should be used in the restricted sense implied in the principal recent classifications of mankind in this area. The physical characteristics of the Negritos are small stature (great majority under 5 feet), a brachycephalic or subbrachycephalic head form, a dark-brown or black skin sometimes somewhat yellowish, the hair woolly (scanty on face and body), a flat nose, thickish lips, and other features of physiognomy and body of a negroid character. Many ethnologists assume that the earliest inhabitants of extreme southeastern Asia, the Malay Archipelago, and neighboring regions were of this stock, but evidence for such a view is lacking. No real proof of their presence in Sumatra, Java, Borneo, Celebes, or Formosa has been produced. It is held by some, however, that the Negritos once inhabited Timor, Flores, and the islands near, while it has been reported that the Karons of the Arfak Hills in northwestern New Guinea were Negritos, and an infusion of Negrito blood has been recognized in other parts of the island, such as the Saddle Mountain region. Definite proof of a predominantly Negrito people in New Guinea was supplied by the discovery of the Tapiro, of Netherlands New Guinea, by the Wollaston expedition (1910). The only centres of undoubted Negrito population existing at present are in the Andaman Islands, the Malay Peninsula, certain of the Philippine Islands, and the interior of New Guinea, the pure Negritos being certainly represented only by the Minicopies, Sakai, Aetas, and Tapiro. The Minicopies of the Andaman Islands average 4 feet, 11 inches in height, are brachycephalic, broad-faced, extremely frizzly-haired, and have a skin of a dull leaden hue. The Semangs and Mantias, in the peninsula of Malacca, may be regarded as Negritos, while the Muntra and the Jakuns of Johore are Sakai-Malay half-breeds, with lighter skin and taller stature. Some authorities, however, regard them as Negritos. The Semangs (whose own name is Mendi or Menik) of northern Perak, Kedah, Rahman, Ranga, and Kelantan are described by Martin, who visited the Malay Peninsula in 1897, as representing a dark-brown ulotrichous variety of man, while the Sakai (whose own name is Senoi) of southeastern Perak and northwestern Pahang are a brown cymotrichous variety. Both are distinct alike from the Malayan and the Mongoloid peoples. The Blandas, Ma-meri (or Besesi) of southern Selangor, the Mantra of the territory of Malacca and Rembau, and the Jakuns of Johore he styles mixed peoples. As to head form, the Semangs are mesocephalic (tending to dolichocephalic with an index of 78 to 79), the purest Sakai are dolichocephalic, and the Besesi brachycephalic. The hair of the Semangs is frizzy or thick woolly, while that of the Sakai and of the mixed tribes is for the most part wavy. The Semangs average 5 feet in height and have remarkably convex lips, a typical Pygmy trait. The Sakai are now classed

with the Veddā and some jungle tribes of the Deccan as remnants of a pre-Dravidian race, which is believed to have had a wide distribution. They are thus not Negritos, but belong to the other main stock of Asiatic Pygmies. The Aetas of the Philippines, who number altogether some 10,000, are found in certain parts of the interior of Luzon, Mindoro, Panay, and Negros, and northeastern Mindanao. Their skin is of a dark-chocolate brown, their mean height is 4 feet, 9½ inches, and the cephalic index of 16 males averages 82.2. The culture status of the Negritos is very primitive, though the arts and industries of the Andaman Islanders, the best-studied members of the stock, give more evidence of talent and ingenious adaptation to environment than is commonly attributed to them. The bow and arrow (often poisoned) is a characteristic Negrito weapon.

NEGRO (Sp., Portug., It. *negro*, black from Lat. *niger*, black). The name properly applied to a subspecies of mankind of whom the chief characteristics are a dark skin, woolly or frizzly hair, and a dolichocephalic skull. The negroid type presents many modifications and has obtained a fairly wide dispersion, but is found in its purest state and in greatest numbers in Africa, and that continent must be considered its centre of distribution.

It is commonly held that the type is best represented by the Sudanese tribes of Africa, who are regarded as true negroes. They are distinguished by a very dark-brown or chocolate-colored skin, black crisp hair which is flat on section, a relatively long head, with flat, broad nose and projecting jaws with thick, everted lips. In stature they are tall, with long arms and slender legs.

The most important modification of this type is found in the Bantu group of tribes, which stretches southward in Africa from the Sudan to the Cape of Good Hope. This division is one based largely on linguistic grounds, and, presenting as it does many variations of slight extent, it is impossible to name any single physical character which distinguishes the Bantu negro from the Sudanese. In general, however, the Bantu face is less coarse than the Sudanese, the jaws less projecting, and the lips not so thick. In color of skin the Bantu shows all shades of dark brown, and in stature corresponds to the Sudanese.

A marked variation, and one difficult to account for, is seen in the dwarf races which are found in scattered groups across Central Africa surrounded by Bantu neighbors and extending far to the south, where they are represented by the well-known tribe of Bushmen. The Bushmen have usually been regarded as forming an independent stock not to be classed with the

Pygmies of the equatorial region, but recently Kuhn and Von Luschan have argued vigorously for the essential unity of these tribes. On the other hand the Hottentots are surely distinct from both and have even been regarded as of Hamitic stock, though hardly on convincing evidence. See Colored Plate in article AFRICA.

The dwarfs offer striking physical traits which differentiate them from the other negroid peoples of Africa. In stature some of the northern Pygmies do not average much over 4 feet, the Bushmen seldom range over 5 feet, while the Hottentots are distinctly taller. In color the skin is a light yellowish brown and, in the true dwarf groups, said to be covered with a sort of down. The hair is crisp and, in the central dwarfs, of a rusty-brown color, while in the Bushmen group it is black and tufted.

Of the true negroes of the Sudan the most important tribes are, in the west, the Wolof, Mandingan, Felup, Timni, Kru, Sierra Leone, Liberian, Tshi, Ewe, Yoruba, Ibo, Efik, Borgu, and Mossi. In the central Sudan the Sonhay, Hausa, Mosgu, Kanembu, Kanuri, Baghirimi, and Yedina, and in the east the Maba, Fur, Nuba, Shilluk, Dinka, Bari, Abaka, Bongo, Mangbattu, Zandeh (Niam Niam), Monfu, and Bari.

Of the Bantu tribes traced southward along the east coast and northward along the west, following their probable course of migration, some of the most important divisions are the Bonjo, Baya, Waganda, Wanyoro, Wapokomo, Wagnyama, Waswhahili, Zulu, Mashona, Bechuana, Ova-Herero, Eshi-Kongo, Bashilange, Balolo, Manyema, Bakalai, Fan, Mpongwe, Dwala, and Batanga.

These peoples include the bulk of the African negroids. The dark-skinned natives of the north, viz., in Abyssinia and in neighboring regions and along the Mediterranean, exhibit such differences and are so allied in other respects with Semitic and Hamitic peoples that they are usually classed with them.

The extra-African distribution of negroid stocks immediately presents difficulties. We can disregard the negroes of the two Americas, who are almost invariably of West African descent and differ from their parent stocks only in the modifications due to mixture with Europeans and Indians.

The Australians must be considered an independent race presenting physical characteristics which differentiate them from the true negro, notwithstanding their dark skins.

There are, however, in the East Indian Archipelago, in New Guinea and Melanesia, and in Madagascar negroid tribes whose classification and relationships present difficulties at present insurmountable. Of these stocks the Papuans of New Guinea and the Melanesians are the most numerous and important. They are a dark-skinned, dolichocephalic race and differ physically from the African negro chiefly in the hair, which is longer and moplike, and in facial features, which latter, however, are variable. There are no safe grounds for considering them as a branch of the true negro stock other than the striking resemblance in skin color.

At different points in the northern portion of this region are found scattered groups of an undersized negroid stock commonly called Negritos (q.v.). They are usually compared with the dwarf races of Africa and undoubtedly do offer striking similarities in physical charac-

ters, but in other respects seem to correspond rather to the Australian and Papuan.

The parentage of the negroids of Madagascar is also in dispute. The proximity of Africa would indicate an origin from that continent, and there are both physical and cultural facts to support the view, but there are also unmistakable signs of Melanesian traits which suggest immigration from both regions.

Much has been written as to the mental capacity of the negro, but trustworthy information is scanty. Such few careful observations as have been made upon negro brains indicate a slightly lower type than that of Europeans, but the variability is so high as to forbid drawing any conclusions regarding the accompanying intellectual powers—a statement which holds true of the natives of Melanesia as well as of Africa.

In culture the negro presents almost as many degrees and varieties as there are stocks. A relatively low grade represented by certain of the Sudanese, Bantu, and dwarf tribes is found side by side with a relatively high civilization, as, e.g., that of the Hausa; but it must be admitted that the sporadic examples of marked cultural progress in Africa can almost invariably be traced to Arabic or other foreign influence. Environment has, of course, produced specific types of culture in different parts of the continent, such as the cattle-breeding, pastoral life of the south and west and the strictly hunting life of the dwarfs of the equatorial forests, and this diversity makes general statements dangerous or impossible.

With regard to religion we find an extensive animism which has developed remarkably at different points. For example, the ancestor worship of the Zulus has been carried to a logical extreme, which is unique among savages, and the complex fetishism of west Africa is everywhere regarded as the type of that phase of belief.

Political organization is equally diverse, ranging from hereditary kingship to such loose tribal systems that no chieftainship is ascertainable.

In comparison with other great groups of mankind the negro seems to possess certain temperamental qualities which are more or less characteristic, being lively, excitable, and fond of social life and discussion, and this trait has undoubtedly played an important rôle in the development of certain phases of African culture. Our knowledge of the majority of the negro tribes of Africa is still lamentably slight, but, with the extension of European interests in that continent, much valuable information is coming to light.

NEGRO, nā'grō, Rfo. 1. A tributary of the Amazon. 2. A river of Argentina. 3. A territory of Argentina. See Rfo NEGRO.

NEGRO BUG. A plant bug of the family Coremelenidae. These bugs are usually of very small size and are intensely black in color, sometimes having a bluish or greenish tinge. They are convex in form, the scutellum covering nearly the whole upper side of the body, and are often mistaken for small beetles. They are fond of laying their eggs on small fruits, like blackberry and raspberry, giving them a very disagreeable taste. A common species in the United States, the flea-like negro bug (*Coremela puticaria*), is frequently mistaken for the chinch bug.

NEGRO EDUCATION. Much of the negro advancement in the United States since the Civil War is to be credited to the regular habits of industry and to the knowledge of the white man's religion, language, and ways of life gained in slavery days. To one connected with negro schools nothing is clearer than the value of the influence of good Southern white families upon their slaves. Some of the plantations were really large trade schools where habits of industry were formed. Carpenters, coopers, sawyers, blacksmiths, tanners, curriers, shoemakers, spinners, weavers, knitters, and distillers were all to be found among plantation slaves, and the negro mechanic was an important man in the community. Thus the race was being gradually trained in the ways of civilization, was contracting the habit of labor, acquiring a superior language and religion, and developing a character capable of further advancement.

Credit should also be given to the training which the colored man received during the Civil War. In the Northern armies there were thousands of colored troops who received discipline of the most valuable sort. In the South the homes and farms of the white Confederate soldiers were largely in the hands of negro men and women. Most valuable to the slaves was the gain in power and executive ability that came out of that experience. While their masters were fighting to keep them in slavery, they were receiving in the absence of those masters the education which was to fit them to be freemen.

Upon the heels of the Northern armies came an army of devoted women, eager to teach the freedmen. In September, 1861, the American Missionary Association opened its first school for contrabands at Hampton, Va., the outcome

of which is the Hampton Normal and Agricultural Institute (q.v.). In the following January schools were started at Hilton Head and Beaufort, S. C., and in 1862 and 1863 teachers were sent to Tennessee. The Rev. John Eaton, an army chaplain from Ohio, afterward United States Commissioner of Education, was placed by General Grant in charge of the instruction of the colored people, of whom it is estimated that more than 1,000,000 learned to read and write; of the 80,000 colored troops in the Northern army, 20,000 learned to read and write. The churches of the North vied with one another in their endeavors to bring education to the black man. In 1865 the Freedmen's Bureau (q.v.) was established, and, in addition to other work, it superintended the education given to the freedmen by the government and the churches of the North. Between 1865 and 1870 more than \$5,000,000 were expended by this organization for educational purposes. In some cases government buildings and land were granted.

The proved capacity of the negroes for education suggested the wisdom and economy of providing their schools with teachers of their own race, and during the years from 1868 to 1878 there were founded 25 normal and collegiate institutions under the control of different religious denominations, the Congregationalists and Baptists leading in the number and size of their schools. They extended from Hampton in Virginia to Tillotson in Texas. At Atlanta, Nashville, Chattanooga, and other centres institutions were built costing from \$200,000 to \$500,000 and having a yearly attendance of from 300 to 500 students. They have trained many of the teachers of the negro race.

The work of these schools has often been criticized and sometimes, perhaps, justly, but it is nevertheless true that they have had much to do with the uplifting of the negro race. From them have gone forth many of the best teachers of the negro public schools. Most of these institutions had as their model the New England high school or college. Latin and Greek had often a prominent place. The practical side of education, which was largely provided for in the New England home, was not supplied in the one-room cabin of the South. Too great emphasis was sometimes placed upon the literary and academic side of education and too little upon the gaining of a knowledge of the common things of life and of the forming of habits of intelligent industry. It was natural that the colored man, after years of forced labor, should revolt against any education that gave prominence to the work of the hand. It was natural that his teacher, who heard it continually said that negroes were fit only to be hewers of wood and drawers of water, should wish to prove that they could become successful lawyers, physicians, and clergymen. The wisdom of raising up leaders of a people is unquestioned, but where 80 per cent of a race live on the land, as is the case with the blacks of the South, and where a large majority live, as the masses of the negro race still do, in one-room cabins under the lien system of crops, it has been recognized that there must be a close relation between education and vocation, and that their teachers and clergymen should be taught how to build their own houses and how to cultivate their land properly.

What is called race prejudice has resulted in a system of public schools taught by colored

teachers which, while it has its disadvantages, has resulted in good to the race.

Before the year 1870 there were practically no negro public schools, with the exception of those in Memphis, New Orleans, and Nashville. There were, however, in the District of Columbia 10,494 colored children in public and private schools. In 1870, while for the most part there was opposition, certain farseeing Southerners declared in favor of the education of the blacks. In 1871 a little improvement was made. In 1872 Delaware and Kentucky were the only States that had not made provision for negro education. In 1873 and 1874 State normal schools began to be established for the training of negro teachers. In 1877 the total number of negro children reported of school age was 1,513,065 and the number enrolled in the schools 571,506. There were 27 normal schools with 3785 pupils and 23 institutions for secondary instruction with 2087 pupils. In 1882-83 the colored school population in the District of Columbia and the former slave States was 1,944,572 and the enrollment 802,982. Thus, less than 20 years after the war there was built up in the South a public-school system for both whites and blacks, with normal schools for the training of teachers, which, considering the poverty of the States, was admirable. In 1897-98 there was an enrollment in the schools of 1,506,742 colored children, or 52.97 per cent of the colored school population, while in 1900-01 there was an enrollment of 51.46 per cent of the negro children. The enrollment for 1903-04 was 1,577,385 and the percentage 55.14. The average daily attendance in the colored schools is 64.38 per cent of their enrollment. In 1912-13 there was an enrollment of 1,769,859 colored children, or 56.05 per cent of the colored school population, and an average daily attendance of 1,089,354, or 61.55 per cent of their enrollment. In the same year there was a total of 156 public high schools and 270 private schools for colored pupils, giving secondary, normal, collegiate, and industrial courses. The number taking secondary courses was 25,559. In addition 29,481 students were taking collegiate and professional courses.

No account of negro education in America would be complete which did not include an account of the work of Gen. S. C. Armstrong at Hampton Institute. Believing in the moral value of self-help, General Armstrong built up a school in which greater prominence was given to doing than to mere learning, where there was not only the schoolroom, but also the workshop; not only the church, but also the farm, not only the training of the mind, but also that of the heart and hand. An effort was made in this school to fit men and women for definite conditions, to develop a love for intelligent work, and to inspire in its pupils a strong desire to go out and help to uplift their people. The school at Tuskegee, founded by Booker T. Washington, Hampton's most distinguished graduate, was established with similar views. While receiving help from the North, both of these schools have put themselves in the closest touch with the South and its public-school system. Their influence on this system has been marked. As a result of the kind of training given at Hampton and Tuskegee, hundreds of young people have been sent out who, by the establishment of homes, the cultivation of land, and the carrying on of business enterprises,

have reconstructed whole communities. There is reason to believe that this type of school is meeting the pressing need, on the part of the negro people, of knowledge of the common duties of life, while, at the same time, it is providing a kind of training which results in the stability of character so lacking in the masses of this people.

In the establishment and conduct of negro schools two wisely administered funds have had a large share. (See PEABODY EDUCATION FUND, SLATER FUND.) Mention should also be made of the Southern and General Education Boards, which are composed of prominent Northern and Southern men. Both these agencies represent a union of wealth, business sagacity, and educational statesmanship that augurs well for the cause of universal education. The Southern Education Board conducts a campaign of education for the purpose of stimulating public sentiment in favor of more liberal provision for the common schools for both races. Its work is supplemented by that of the General Education Board, which, in addition to collecting information in regard to existing educational conditions among both races, disburses certain funds where they are most needed for the strengthening of the agencies tending to promote the education of all the people. The board, e.g., cooperates with State departments of education by paying the salaries and expenses of State agents for negro rural schools in the South. The function of the agents is not only to educate the public, but to improve school curricula along industrial and domestic lines and encourage fair demonstration and clubs. The board also cooperates with and manages the Anna T. Jeanes Fund for supporting industrial supervisors and teachers. Through the State supervisors, again, the negro teachers are improved by the holding of institutes and summer schools. Finally, the board, through its support of negro colleges, encourages the training of leaders of the race.

NEGRO EXODUS. The name applied to a movement of freedmen from the Southern to the Western and Northern States in 1879 and 1880.

The movement began in the early spring of 1879, and before the close of 1880 fully 40,000 negroes had removed to Kansas alone, while a large number had settled in Missouri and Indiana also. Many arrived at their destination poorly clad, generally destitute, and without promise of employment, and for a time there was much want and suffering among them. Large sums of money, however, were contributed for their relief throughout the North, and especially in Kansas, where, soon after the arrival of the first band of immigrants, an efficient Freedmen's Relief Association was organized. The only Southern States from which the blacks emigrated in any considerable numbers seem to have been Mississippi, Louisiana, and Texas. The chief reasons given by the negroes for the abandonment of their homes were that they were forced to pay excessive rents, that the system of land tenure in the South was unjust, that exorbitant prices were charged by credit merchants, and that the freedmen were wholly denied political recognition and were kept down in every way by bulldozing methods. Opponents of the movement asserted that the negroes had been misled by the representations of land speculators, by misguided philanthropists, and by politicians who, in view of the approaching presidential election, wished to import numbers of Republican voters into various parts of the North, where the Republican majority was doubtful. The movement seems to have been considerably furthered by the Nashville Colored Convention, which met in Nashville, Tenn., May 7, 1879, adopted a report setting forth the grievances of the blacks and the many disadvantages, social, economic, and political, under which they labored in the South, and recommending that the negroes should emigrate to those States where their rights were not denied them. For an account of the causes of the movement, consult an article by Runnion, "The Negro Exodus," in the *Atlantic Monthly*, vol. xlv (Boston, 1879), and for arguments justifying and condemning the movement, consult articles by R. T. Greener and Frederick Douglass, respectively, in the *Journal of Social Science*, vol. xi (ib., 1888).

NEGRO IN AMERICA. The first appearance of the negro in the English colonies in America was in 1619, when a cargo of negro slaves was landed at Jamestown. The scarcity of labor, especially in the Southern colonies, created an increasing demand for negro slaves, and by 1714 the number had increased to 58,850 (estimated). The greater part of these were brought direct from Africa, although considerable importations from the West Indies took place, and natural increase contributed an appreciable number. Importation was carried on more extensively in the following half century, the aggregate of negroes in the colonies reaching about 300,000 in 1754. In 1790 the first census found 757,208 in the United States. In the next 100 years this number was multiplied tenfold. This extraordinary growth in numbers has been due chiefly to natural increase, although importations were considerable up to 1808, when they were prohibited by the Constitution. The smuggling in of Africans continued, however, up to the Civil War. Since that time there has been some immigration of negroes from the West Indies, not sufficient, however, to affect the truth of the proposition that recent growth in negro population practically represents a natural increase.

It is a matter of great importance whether or not the negro population is increasing more rapidly than the white. Table I shows the number of negroes in the United States for each decade from 1790 to 1910, together with the percentage of the total population which the negroes represent.

TABLE I

CENSUS	Negroes	Percentage of total population of United States
1790	757,208	19.3
1800	1,002,037	18.9
1810	1,377,808	19.0
1820	1,771,656	18.4
1830	2,328,642	18.1
1840	2,873,648	16.8
1850	3,638,808	15.7
1860	4,441,830	14.1
1870	4,880,009	12.7
1880	6,580,793	13.1
1890	7,488,788	11.9
1900	8,833,994	11.6
1910	9,827,763	10.7

It will be seen that the proportion of negroes to the general population has declined for every decade since 1810 except 1870-80, and it is now generally understood that the apparent increase for that decade was the result of faulty enumeration. It is true that much of the relative increase in white population is to be ascribed to immigration (qv). Nevertheless, it appears that the native white population is increasing faster than the negro population. Thus, for the decade 1900-10 the native whites of native parentage increased 20.9 per cent, while the negroes increased only 11.2 per cent.

Distribution of Negro Population. In the Colonial period negroes were found in every Colony, but were most numerous in the South, where their services were in greater demand. The abolition of slavery in the North led to greater concentration in the South, and by 1860, out of 4,441,830 in the United States, only 226,216 lived in the Northern States. Since the war a considerable diffusion has taken place. At times it has been feared that a large proportion of the negroes would flock to the North, but adverse climatic conditions and the difficulty of competing with white labor have forced most

55.2; Louisiana, 43.1; Georgia, 45.1; Florida, 41.0. A more detailed statistical study would show a tendency of the negroes to concentrate in limited areas in some of the Southern States. Thus, in the three counties, Issaquena Co., Miss., Tensas Co., La., and Tunica Co., Miss., negroes represent 94.1, 91.5, and 90.6 per cent of the total population.

Economic Condition of the Negro. As a laborer the negro is capable of the hardest physical toil, and works without difficulty where the humidity and heat render labor intolerable for the white. He is lacking in stability, and is inclined to roam from one district to another without any satisfactory reason, he is wasteful and careless, requiring constant supervision. These characteristics have largely determined his economic position. As an agricultural laborer the negro is indispensable in the South, more especially in the low, swampy districts, where the white laborer readily succumbs to disease. As a domestic servant the negro has proved his usefulness. In manufactures, on the other hand, negro labor is unsatisfactory, since the negro will not remain in a position long enough to develop a high degree of skill. The same deficiency is driving him out of the handicrafts. Under slavery a large number of negroes were trained in handicrafts, and proved to be valuable workmen after emancipation; but the generation since slavery has manifested an unwillingness to enter upon the long period of training necessary for the exercise of the trades. The tendency towards agricultural labor and personal service is illustrated by the statistics of occupations of the thirteenth census. Out of 5,192,535 engaged in gainful pursuits, 886,736 were engaged in domestic service and 2,857,732 in agriculture. The economic progress of the negro, except as an owner of land, is not susceptible of statistical determination. The amount of property of all kinds held by negroes is conservatively estimated at over half a billion dollars. The annual meetings of the National Negro Business League, organized in 1900, attest a decided advance in the number and magnitude of enterprises conducted by negroes.

The wages of the negro agricultural laborer in the South usually range from \$6 to \$10 a month, with substantial additions in the shape

TABLE II

DISTRIBUTION OF NEGROES

DIVISIONS	1880	1890	1900	1910
North Atlantic division	229,417	269,906	385,020	484,176
South Atlantic division	2,941,202	3,262,690	3,729,017	4,112,488
North Central division	383,621	431,112	495,751	543,498
South Central division	3,012,701	3,497,887	4,193,952	4,636,939
Western division	11,852	27,081	30,254	50,652

of the negroes to remain in the South. See Table II for the distribution of negroes.

Relatively to the general population the negroes increased in the last decade in the States of Vermont, New York, Illinois, Iowa, West Virginia, Arkansas, Wyoming, Utah, Nevada, and California.

Georgia had a negro population in 1910 of 1,176,987; Mississippi, 1,009,487; Alabama, 908,282; South Carolina, 835,843. Virginia, North Carolina, Louisiana, and Texas exceeded 600,000. In Alabama the negroes are 42.5 per cent of the total population, South Carolina,

of food, house room, etc. In the busy season of the year the day laborer usually receives a far higher wage. A good cotton picker in the Yazoo-Mississippi delta often earns \$1.50 a day. Whether wages are high or low, the negro laborer is likely at any time to leave his employment, with resulting embarrassment to the employer. Hence it is a common practice to let small holdings to negroes, in order that interest in the crop may diminish their migratory tendencies. According to the census of 1910, 890,141 farms were occupied by negroes, of which 175,200 were owned by their occupants; 43,177

farms in addition were part owned. The tenant farmers sometimes pay a cash rental, but more frequently farm on shares. The landowner furnishes machinery and draft animals, receiving one-half the crop. Frequently he advances food and other supplies to the tenant, recouping himself out of the tenant's share in the crop. Share tenants represented 43.1 per cent of all negro farmers in 1910.

While the negro farmer still remains handicapped by lack of education, forethought, and technical skill, he is making notable progress in the direction of economic independence. Farms owned by negroes in the South increased in value from \$123,754,396 in 1900 to \$275,323,227 in 1910, or 122.5 per cent. The corresponding percentage increase for white owners was 99.6. In the North the negro manifests a tendency to concentrate in the cities, where his economic activities are chiefly confined to personal service and unskilled labor.

Social and Moral Conditions. When account is taken of the fact that the ancestors of the American negro were taken from a state of barbarism and were subjected only to comparatively weak moral restraint under slavery, it does not appear surprising that the social and moral condition of the negro is unsatisfactory. The great mass of the negro children receive an inadequate home training, and are therefore left to pursue their own inclinations, with the result that they readily lapse into their ancestral vices. The rules of monogamic marriage are but loosely obeyed—the exchanging of wives, e.g., being not uncommon on Southern plantations. Illegitimacy is common. In the cities adverse social conditions for which the negro is only in a small measure responsible increase the tendency to moral disorder. The negro quarter is usually in close proximity to the quarters given over to professional vice, and often the two are interpenetrating. Whether conditions are improving or deteriorating in this respect it is impossible to prove. It is, however, the testimony of a large number of observers that wherever the negro withdraws from the presence of the white population, moral conditions deteriorate, hence the tendency towards segregation noted above is generally viewed with anxiety by those who are most deeply interested in the improvement of the negro race. Wherever the economic conditions of the negro are improving, on the other hand, family life and morals also show a tendency towards improvement. The poverty of the masses of the negroes at present results in the overcrowding of cabins and tenements, which is destructive of family life and morality. For this reason students of the race problem look to the technical education of the negro as the best method of elevating him morally.

Statistics of crime present another serious problem connected with the presence of the negro in the United States. In 1890 there were in the Southern States 6 white prisoners to every 10,000 whites, and 29 negro prisoners to every 10,000 negroes. In the Northern States there were 12 white prisoners to every 10,000 whites, 69 negro prisoners to every 10,000 negroes. In the South negro prisoners increased 29 per cent per 10,000 between 1880 and 1890, while white prisoners increased 8 per cent per 10,000. In 1910 the enumeration of prisoners and juvenile delinquents for the United States as a whole gives the number of whites as 93,841 and the number of negroes as 42,631, or 45 negro pris-

oners to every 100 whites, as compared with 10.7 negroes to 100 whites in the general population. While it is no doubt true that a larger percentage of crimes against property committed by negroes is detected and punished, and hence the relative amount of negro criminality may be exaggerated, it is also true that a large number of negro crimes committed against members of their own race are not punished at all, and so do not appear in the statistics of criminality. Crimes of violence appear to be increasingly frequent where the negroes are least in contact with the whites.

The greatest improvement in the position of the negro appears in the statistics of education. At the close of the Civil War it is doubtful whether more than 5 per cent could read and write. In 1900 the percentage of illiteracy had been reduced to 44.5 per cent. A further decrease to 30.4 per cent had taken place by 1910.

Political Condition. After the close of the Civil War, the negroes, under the leadership of a certain class of whites, practically controlled the government of many of the Southern States. (See RECONSTRUCTION.) Their ignorance and lack of political training rendered them incapable of exercising political power wisely, and they were gradually excluded from power by the whites, at first by wholly illegal means, later by State laws and constitutional amendments. In 1890 the constitution of Mississippi was amended so as to exclude from the suffrage any person unable to read any section of the constitution or to understand it when read to him and give a reasonable interpretation of it. Payment of a poll tax was also required. The effect of this amendment was the exclusion of the greater part of the negro vote. In 1895 South Carolina amended its constitution so as to exclude the vote of any one unable to read or write any section of the constitution, or to show that he owned and paid taxes on property assessed at \$300 or more. In 1898 Louisiana passed a similar amendment, with the addition of the so-called grandfather clause excusing from the limitations of the amendment all descendants of men who voted previous to the war, thus admitting to the suffrage illiterate, propertyless whites. North Carolina took similar action in 1900, though no property qualification was required. In 1901 a constitutional amendment was adopted in Alabama practically disfranchising the negro. Georgia took similar action in 1908 and Oklahoma in 1910. In 1915 the grandfather clause of the Oklahoma law was held unconstitutional by the United States Supreme Court.

For the solution of the various negro problems, social, economic, and political, several plans have been brought to public attention. Repatriation of the negro in Africa was widely advocated, especially in the first two decades after the Civil War, but the plan has been generally abandoned as impracticable, since the negro manifests no desire to return to Africa, and could not be forced to emigrate against his will. From a moral point of view, the plan has been condemned on the ground that it would mean a reversion to barbarism of the greater part of the race. Economically its effects would be grave, since the Southern States must for a long time rely upon the negro for unskilled labor.

The plan which finds greatest favor at present is the industrial education of the negro, the encouragement of landownership by those who are now tenants, and the general extension of

education. (See NEGRO EDUCATION.) The plan has already produced valuable results. Graduates of institutions like Tuskegee (q.v.) and Hampton Institute have proved that under the leadership of members of their own race negro communities are capable of rapid improvement, economically and morally. See NEGRO, NEGRO EDUCATION, SLAVERY.

NEGRO LETHARGY. See SLEEPING SICKNESS.

NEGRO MELODIES. The music of the American negroes is essentially vocal. Their few musical instruments are of importance only for furnishing accompaniments to songs or for accenting the rhythm of the dance. Negro music has been steadily losing its distinctive features, owing to the tendency among the younger generation to discard everything which harks back to the days of slavery. The old plaintive melodies have been replaced largely by more modern comic and erotic songs which are cast in a non-descript Afric-European mode.

Negro songs may be divided into two general groups—those which show evidences of foreign origin, but which have been added to and changed until they are undeniably negro in character; and those which are the spontaneous expression of the negro's own feelings. The first group may be subdivided into (a) those derived from European songs and dances and (b) those adapted from Baptist and Methodist hymns. The original negro songs, whose most typical element is a weird recitative, have undoubtedly an affinity with the musical forms used in Africa, but they have been greatly expanded both rhythmically and melodically. Though it is possible to make some such analysis of negro melodies, the most important feature, their interpretation, cannot be adequately described. Impromptu chords, notes, and accents are introduced, the whole blending into unusual forms with strikingly original melodies and motives. Strange to say, the time structure is excellent, and the tempo is universally exact. The tunes have as a rule a range of few notes, and, as in Africa, the major key predominates. In some songs both

the major and minor keys are used. The weird effect produced by many of their cadences is not as a rule due to the use of the minor key so much as to the employment of the pentatonic scale and the major scale with the flat seventh. A distinctive character of negro melodies is the rhythmical snap, which became such an over-worked feature in "ragtime." See FOLK MUSIC, RAGTIME. Consult: F. L. Ritter, *Music in America* (new ed., New York, 1900), C. L. Edwards, *Bahama Songs and Stories* (ib., 1895), J. B. T. Marsh, *The Story of the Jubilee Singers and their Songs* (Boston, 1880), H. E. Krehbiel, *Afro-American Folk-Songs* (New York, 1913).

NEGRO MONKEY. 1. A sooty black langur (*Semnopithecus maurus*, or *Pygathrix aurata*), about 24 inches long, plus a still longer tail. The animal is well known in Java. Its young are reddish in color and grow black with advancing age. 2 A marmoset (*Midas*, or *Cercopithecus, ursulus*) of Brazil, also called negro tamarin, and often tamed. It is black, with a reddish dorsal stripe. See LANGUR.

NEGROS, nā'grōs. One of the Philippine Islands, belonging to the Visayas group. It lies between the islands of Panay and Cebu. It is separated from Panay and the small island of Guimaras on the northwest by the Strait of Guimaras, 8 miles wide at the narrowest, and from Cebu on the east by the Strait of Tañón, from 6 to 22 miles wide (Map: Philippine Islands, D 6). On the north the island borders on the Visayan Sea, and on the southwest and south it is washed by the Sulu Sea, which to the southeast separates Negros by a distance of 30 miles from Mindanao. The island is roughly rectangular, but very elongated in shape. Its length is 134 miles, and its average breadth 26 miles, increased near the southern end to 34 miles by a broad, rounded peninsula extending from the western coast. Its area is given as 4881 square miles. Including a number of small dependent islets, the area is 4994 square miles. It ranks fourth in size among the Philippine Islands.

The coasts are clear and steep, but very little indented, and afford no harbors except a few anchorages sheltered by the small adjacent islands. The whole interior consists of a mountainous plateau with a central ridge containing peaks above 4000 feet, running the entire length of the island and dividing it into two distinct halves, forming its two political divisions. The active volcano of Canlaón, or Malaspina, situated in the north-central part of the island, is 8192 feet high, but the island suffers less from volcanoes than others of the archipelago. The range terminates at the north in the remarkable isolated peak Solitario. The two slopes are eroded into numerous lateral valleys watered by short and generally simple streams, the largest being on the western slope. In the southern part are two remarkable mountain lakes, the larger 6 miles long. The mountains of the interior are covered with vast forests of valuable timber, among which the teak is prominent. The soil is everywhere fertile, and agriculture is the principal occupation. The chief products are sugar, manila hemp, copra, tobacco, rice, cacao, and corn. Negros Occidental is one of the most important sugar-growing regions of the islands. The fisheries are next in importance to agriculture, and cattle raising also receives considerable attention, large numbers of horses, carabaos, and hogs being raised.

There are no manufactured products of importance, the few that there are being outgrowths of the agricultural activities of the inhabitants. The interior, once an impenetrable wilderness, is fast being opened. The population of the island in 1903 was 460,776, of whom 21,217 were wild. The prevailing race is the Visayan, and the Visayan is the language most spoken. The forests of the interior are inhabited by roaming savages. Politically the island is divided into the two provinces of Negros Occidental and Negros Oriental, whose areas, respectively, are 3130 and 1864 square miles, and whose populations are 308,272 and 201,494. The island of Sequijor, which is part of Negros Oriental, has an area of 106 square miles, and in 1903 had a population of 46,023. The capital of the former is Bacolod, and of the latter Dumaguete. The two old provinces were continued under civil government by the Philippine Commission Act of Feb. 6, 1901. Some resistance was offered to the authority of the United States by bands of natives, who kept American troops actively engaged on the island during the campaigns of 1899 and 1900. Consult *Apuntes de la Isla de Negros* (Manila, 1894).

NEGRUZZI, nă-gruot'st, KONSTANTIN (1808-68). A Rumanian poet, born at Jassy, the disciple and translator of the poet Pushkin. He also translated some of Hugo's works, and wrote an epic poem, *Aprodul Purce*, and a volume of verse and prose, *The Sins of Youth Alexandru Lăpusneanu*, a historical short story, is one of the masterpieces of Rumanian literature. His *Complete Works* were published in 1873. His son, JACOB (1843-), was born at Jassy and became professor of commercial law at the university there, and afterward at Bucharest (1885). In 1867 he founded the literary journal, *Convorbiri Literare*, of which he was for 28 years the editor. His writings include *Poesii* (1872); *Miron și Florica*, an idyl. *Mihail Vereanu*, a novel, the short stories in *Copii după natură*; and a number of plays. His *Collected Works* were published at Bucharest (6 vols., 1894-96).

NEGUNDO (Neo-Lat., from the North American Indian name). A group of trees sometimes separated from *Acer* as a genus of the family *Aceraceæ* (see MAPLE), differing from the maples chiefly in the apetalous dioecious flowers and in the pinnated ashlike leaves. The common species, *N. aceroides*, known as ash-leaved maple, or box elder (qv), is a native of North America, often planted for ornament and extensively cultivated in the western United States. It is now generally referred to as *Acer negundo*. See PLATE of BIGNONIA.

NEHAN'TIC. See NIAN'TIC.

NEHEMIAH (Heb. *Nēhemyah*, Yahwe is consolation). A Hebrew leader of the fifth century B.C., whose memoirs are embodied in the Book of Nehemiah of the Old Testament. It is there stated that he was a son of Hachaliah, and cupbearer to Artaxerxes (i.e., Artaxerxes I, Longimanus, 465-425 B.C.), in the palace of Shushan. Having learned the sad condition of the returned colonists in Jerusalem, he prevailed upon the King to send him to his brethren there with full powers "to seek their welfare." He received an appointment as governor, and worked for the safety of the city and its inhabitants. He rebuilt the city walls, notwithstanding many hindrances and dangers; he induced people from the country—priests and laymen—to take up

their abode in the city, thus promoting its prosperity, above all he rekindled the flame of ancient piety and enthusiasm for the observance of the law in the hearts of the rough immigrants. He then returned to Persia, trusting to the new vitality which his reforms had, as he thought, infused into the Jewish commonwealth. But not long afterward he had again to obtain leave from the King to return for the purpose of abolishing many abuses that had crept in during his brief absence. He enforced the rigorous observance of feast and Sabbath, and rearranged the temple service, procuring at the same time the means for its proper support by inducing the people to offer the tithes as of old.

Owing to the changes in the memoirs of Nehemiah which have been made in the course of the different editings to which they have been subjected (see NEHEMIAH, BOOK OF), it is difficult to separate the actual course of events from the traditional view concerning Nehemiah's activity. This much, however, seems certain that Nehemiah paid two visits to Jerusalem, the one in 445 B.C., the other probably in 433. He came the first time on a special mission to protect Jerusalem from attack by rebuilding the walls, and for this work he was intrusted with full powers by the Persian King. He completed the restoration of the walls in the short space of 52 days, and provided for the proper guarding of the gates, afterward he returned to the Persians. In this visit he appears as the governor. In the second, however, he holds no such office; his purpose is to insure the enforcement of the rules against marriages between Jews and non-Jews. See EZRA.

NEHEMIAH, BOOK OF. One of the historical books of the Old Testament. In some Greek and Latin versions it is called the Second Book of Ezra, and in the Jewish canon the books of Ezra and Nehemiah originally constituted one book. It is the opinion of modern scholars that both books were put into their present form by one and the same editor (See EZRA, BOOK OF). The period covered by the Book of Nehemiah is the years 445-432 B.C. It is based upon the genuine memoirs of Nehemiah, but also, according to the critical view, contains much extraneous material, the memoirs having been freely used by compilers whose aim it was to prove that the work of restoration of the temple, the cult, and the general reorganization was performed by Babylonian Jews who returned from the exile, whereas, as a matter of fact, much of the work was due to the section of the Jewish community of Jerusalem which had remained in the country. The contents of the book may be summarized as follows. Nehemiah's sorrow over the desolation of Jerusalem is depicted, and he prays to God for opportunity to rebuild the city (chap. i). Permission is granted him by the King to undertake the work, he arrives at Jerusalem, surveys the ruins, and begins to rebuild the walls (chaps. ii-iii). The opposition of enemies is related and the plans by which their schemes were defeated (chap. iv). The people complain against the oppression of the nobles, and the evil is redressed (chap. v). Enemies form a plot to interrupt the work, which is frustrated by Nehemiah's boldness (chap. vi). A record of the families that returned first from Babylon is given, followed by an account of the offerings made by rich and poor for the work (chap. vii). The law is read by Ezra the Scribe, accompanied with a joyful celebration of the

Feast of Tabernacles (chap. viii). The people mourn, fast, and repent, a full confession of sin is made and a solemn covenant sealed by princes, priests, and Levites, and confirmed with an oath by the whole multitude to observe the law, sanctify the Sabbath, sustain the services of the temple, and bring in all the tithes (chaps. ix-x). A tenth of the people are selected by lot to dwell in Jerusalem, and the rest are distributed through the other cities of the land (chap xi). A list of priests and Levites is given, and the joyous dedication of the wall, accompanied with sacrifices, is described (chap. xii). During Nehemiah's absence in Persia heathen strangers were admitted into the temple, they are expelled after his return, and the broken covenant to pay the tithes, to sanctify the Sabbath, and to refrain from mixed marriages is enforced (chap xiii).

The chronological questions involved in the Book of Nehemiah will be found discussed in the articles EZRA, BOOK OF, NEHEMIAH. As to how much of the book represents Nehemiah's memoirs, scholars are not agreed. The genuine historical basis of the work is probably the account of Nehemiah's first visit, his activity in the rebuilding of the walls, his return to Persia, and his subsequent second visit to Jerusalem. For literature, consult the works mentioned under EZRA, BOOK OF.

NEHLIG, nã'lg', VICTOR (1830-1910). An historical painter, who was born in Paris and lived there most of his life. He was a pupil of Cogniet and Abel de Pujol, and came to the United States in 1850. He opened a studio in New York, and in 1870 was made a member of the National Academy of Design. In 1872 he returned to Paris. Nehlig painted chiefly historical scenes, among the best of which are the "Bravo" (1870), "Armorer of the Olden Time," "Gertrude of Wyoming," the "Artist's Dream," the "Cavalry Charge of Lieutenant Hidden," New York Historical Society; "Battle at Antietam," in possession of William Astor, New York, the "Captive Huguenot," "Pocahontas," "Hiawatha," the "Serenade," and "Waiting for my Enemy."

NEHRING, nã'ring, WLADISLAW (1830-1909). A German Polish scholar, born at Kletzko, near Gnesen. He was educated at the University of Breslau, where he was appointed professor of Slavic languages and literature in 1868. Among his publications are *Kurs literatury polskiej* (1866); *Studia literackie*, a collection of monographs on the literature of Poland (1884); "Ueber den Einfluss der altösterreichischen Literatur auf die altpolnische," in *Archiv für slavische Philologie* (1876 et seq.); *Iter Florianense* (1871); a Latin (1856) and a Polish (1860-62) work on the Polish historians of the sixteenth century; *Altpolnische Sprachdenkmäler* (1887), and a revision of Poplinski's *Grammatik der polnischen Sprache* (1901). Consult the obituary notice by Jagie in *Archiv für slavische Philologie* (Berlin, 1909).

NEIDHART VON REUENTHAL, nî'hãrt fôn roi'en-tãl (c.1180-c.1250). A German poet, born in Bavaria. He participated in the crusade against Damietta, Egypt (1218-19), and later resided at the court of Frederick the Quarrelsome in Vienna. From Frederick he received a fief near Melk and other valuable gifts. He was the originator of a new form of the medieval lyric—the peasant lyric written under the influence of the court. In this he satirizes the

wealthy but vulgar peasantry of Bavaria and Austria, with its display of finery, its brawls, and its insolence to betters. For this ridicule he was bitterly disliked by the rustic versifiers and, by the name Neidhart Fuchs, was known as the enemy of the peasants as late as the sixteenth century. Neidhart's work was an important one in the development of the Volkslied, upon which it continued for two centuries to leave a distinct impression. Neidhart is co-hero with the Pfaff Amis of Anastasius Grun's (Count Auersperg's) *Pfaff vom Kahlenberg* (Leipzig, 1850; 3d ed., 1877). A manuscript collection of his poems, dating from the thirteenth century, was edited by Benecke, in volume 11 of the *Beiträge zur Kenntnis der altdutschen Sprache* (Göttingen, 1832). The critical edition by Haupt (Leipzig, 1858, Keinz, 1889) is excellent. Consult: Von Liliencron, "Ueber Neidharts höfische Dichtpoesie," in *Zeitschrift für deutsches Altertum*, vol. vi (Leipzig, 1848); also Wilmanns, in the same journal as above, vol. xxix, Bielschowsky, *Leben und Dichten Neidharts von Reuenthal* (Berlin, 1891); Pfeiffer, *Die dichterische Persönlichkeit Neidharts* (Paderborn, 1903).

NEILE, nêl, RICHARD (1562-1640). An English ecclesiastic, born at Westminster and educated at St. John's College, Cambridge. In 1605-08 he was dean of Westminster, and he held the bishoprics of Rochester (1608-10), Lichfield (1610-14), Lincoln (1614-17), Durham (1617-28), and Winchester (1628-31). In 1631 he was appointed Archbishop of York. In 1608 he made William Laud his chaplain and subsequently promoted Laud's advancement. Very active politically, he was made Privy Councillor in 1627 and participated regularly in the Star Chamber and High Commission sessions. His correspondence with Laud and others is considered a valuable historical source.

NEILGHERRY (nêl'gê-ri) **HILLS**. Mountains in India. See NILGIRI HILLS.

NEILGHERRY (or **NILGIRI**) **NETTLE** (*Girardinia palmata*). A plant of the family Urticaceæ, nearly allied to the true nettles and possessing the stinging power common in them. It is frequent on all the higher ranges of the Nilgiri Hills. The natives obtain the fibre by first boiling the plant, to destroy its stinging properties, and then peeling the stalks. There are said to be two or three distinct forms or varieties of Neilgherry nettle fibre, and different specific names have been given the plants producing them. Its bark yields a long, soft, and silky fibre, which is said to be one of the best produced in India.

NEILL, nêl, CHARLES PATRICK (1865-). An American commissioner of labor, born at Rock Island, Ill. He studied at the universities of Notre Dame (Indiana) and Texas and graduated from Georgetown (A.B., 1891) and Johns Hopkins (Ph.D., 1897). He was an instructor at Notre Dame in 1891-94 and instructor and associate professor of political economy at the Catholic University (Washington, D. C.) from 1897 to 1905. Thereafter until 1913 he was United States Commissioner of Labor, served as Commissioner of Labor Statistics from March to May, 1913, and then became connected with the American Smelting and Refining Company at New York. He served also as vice president of the District of Columbia Board of Charities (1900-08), as assistant recorder of the Anthracite Strike Commission (1902), as recorder of the Birmingham (Ala.) Arbitration Board

(1903), and as member of the United States Immigration Commission (1907-10).

NEILL, EDWARD DUFFIELD (1823-93). An American author and educator, born at Philadelphia. He attended the University of Pennsylvania for a time, but graduated at Amherst in 1842 and afterward studied theology at Andover. After ordination as a Presbyterian minister he removed to St. Paul, Minn., in 1848 and became pastor of the first Protestant church. In 1851-53 he was Superintendent of Public Instruction for the Territory and from 1858 to 1861 chancellor of the State university. In 1861-64 he was an army and hospital chaplain in the Civil War. From that time until 1869 he was one of the secretaries of Presidents Lincoln and Johnson. President Grant appointed him Consul to Dublin in 1869, but he returned the next year. In 1873-84 he was president of Manchester College in St. Paul and from that time until his death professor of history and literature. He published many historical works, chiefly concerning the Colonial period. They are drawn entirely from original documents and contain much valuable material, arranged, however, with little sense of proportion. The most important are: *History of Minnesota* (1858, 5th ed., 1883); *Terra Maræ* (1867), a history of early Maryland, *History of the Virginia Company of London* (1869), *English Colonization of America during the Seventeenth Century* (1871); *Minnesota Explorers and Pioneers* (1881); *Virginia Vetusta* (1885), *Virginia Carolorum* (1886).

NEILL, JAMES GEORGE SMITH (1810-57). A British soldier, born near Ayr, Scotland. He studied at Glasgow University, became a cadet in the service of the East India Company in 1827, and from 1828 to 1852 served with the First Madras European Regiment. When the Second Burmese War broke out in 1852, he was appointed deputy assistant adjutant general on the staff of Sir Scudamore Steele. During the Crimean War in 1855-56 Neill was second in command of the Turkish contingent. Returning to India in 1857, he occupied Benares and Allahabad when the Indian Mutiny broke out, suppressing the mutineers at those places with the utmost severity. During the operations of Havelock's column about Cawnpore Neill failed to support loyally his superior officer, but in the final advance to Lucknow he commanded the right wing of Havelock's army. While leading a successful assault on the rebellious sepoys besieging Lucknow, he was killed.

NEILSON, nel'son, (LILLIAN) ADELAIDE (1846-80). The assumed name of an English actress, Elizabeth Ann Brown. She was born in Leeds of poor parents, who moved to Guiseley. When 14 years old she ran away from home and, going to London, was educated for the stage through the kindness of a chance acquaintance, making her debut in 1865 in the part of Juliet. She played for a few years in various theatres of London and the provinces till 1870-71, when she met great success as Amy Robsart in an adaptation of *Kenilworth* and as Rebecca in *Ivanhoe*. At once she became one of the favorites of the English stage and was equally popular in America, where she appeared nearly every year from 1872 to her death. Her great characters, besides those mentioned, were the Shakespearean Rosalind, Beatrice, and Imogen, and also Julia in *The Hunchback*. Early in her career she was married to Philip Lee, from whom she was di-

vorced in 1877. She died suddenly in Paris when at the height of her career. Consult: Marston, *Our Recent Actors* (London, 1890); Scott, *The Drama of Yesterday and To-Day* (ib., 1899); William Winter, in *Other Days* (New York, 1908) and *The Wallet of Time*, vol. i (ib., 1913).

NEILSON, JAMES BEAUMONT (1792-1865). A Scottish inventor, born at Shettleston, near Glasgow. He had little education in school and at 14 was set to work. He was first employed by his brother near Glasgow, later as engineer of a colliery near Irvine, and in 1817 as foreman of the Glasgow gas works, with which he remained for 30 years. There he made many improvements in gas manufacture, including the use of clay retorts and of sulphate of iron as a purifier, and founded an institute for the education of employees. His great invention, that of the hot blast in manufacturing iron, was directly opposed to the belief of contemporary foundrymen that the colder the blast the better the quality and the greater the quantity of iron produced, and his experiments were long blocked by the impossibility of a fair test. Neilson's patents, taken out in 1828, were very successful. With equal fuel his method produced three times the iron of the cold blast. But the validity of the patents was attacked with some success, and many firms refused to pay the license for the blast. Neilson won the great suit against the Bairds of Gartsherrie in 1843 and four years afterward retired to the Isle of Bute. His last years were spent at Queenshill, Kirkcudbright, where he established a workingman's institute. See IRON AND STEEL, METALLURGY OF.

NEILSON, JOHN (1776-1848). A Canadian journalist and statesman. He was born in Kirkcudbrightshire, Scotland, went to Lower Canada in 1790, and seven years afterward became editor of the *Quebec Gazette*, the first newspaper ever published in Canada. It was printed both in French and in English and under his direction became an influential organ of public opinion. Neilson was elected a Liberal member of the Lower Canada Assembly in 1818 and identified himself strongly with the cause of the French Canadians, not in encouraging separation or rebellion, but in contending by constitutional means against any encroachment upon their rights and privileges. In 1822, along with Louis Joseph Papineau (q.v.), he was a delegate to England to oppose the contemplated union of Upper and Lower Canada, and in 1828 and 1834 he went again to England on the same mission. After the Act of Union was passed in 1841 he still remained opposed to it, and its subsequent history largely vindicated his course. He was elected a member of the Canada Legislative Assembly in 1840 and later was offered, but declined, the speakership of the Legislative Council. In 1844, however, he became a member of that body. During the latter part of his life he was the real leader of the French Canadians, and though for many years the friend of Papineau, the latter's extreme course severed the ties that had long united the two men. Consult J. C. Dent, *The Last Forty Years* (Toronto, 1881).

NEILSON, JULIA (1869-). An English actress, born in London. She studied music at Wiesbaden, Germany, and (1864-86) at the Royal Academy of Music, London. Her first appearance was as Cynisca in *Pygmalion and Galatea* in 1888. She married the actor Fred Terry (q.v.) and was joint manager with him

after 1900. She had played with Lewis Waller, Beerbohm Tree, John Hare, George Alexander, and others, at the Haymarket, Savoy, Adelphi, and St. James's in London, making a particular success as Rosalind in the phenomenal run of *As You Like It*, and toured Canada and the United States (1895, 1910). For her daughter, see TERRY, PHYLLIS NEILSON.

NEILSON, SAMUEL (1761-1803). An Irish politician, founder of the United Irish Society. He was born at Ballyrone, County Down, the son of a Presbyterian clergyman, and established himself in Belfast as a woolen merchant, but his interest in politics soon forced him out of business. In 1792 he became editor of the *Northern Star*, an organ founded under the auspices of the United Irishmen. The formation of this society had been suggested by Neilson in the previous year and was carried out by Wolf Tone. The *Star* was suppressed in 1797 after the editor, who aimed at the establishment of a republican government and complete separation from England, had several times suffered arrest and imprisonment. Rearrested in 1798, Neilson either bargained with the government in behalf of all political prisoners that they were to be exiled to some country friendly to Great Britain, and in return would disclose the secrets of the United Irish Society, or in some other way managed to escape trial. In 1802 he was set free at Cuxhaven, soon afterward came to the United States, and died at Poughkeepsie, N. Y.

NEILSON-TERRY, PHYLLIS. See TERRY, PHYLLIS NEILSON.

NEIRA (nā'ê-râ) **BANDA.** One of the Banda Islands (q.v.)

NEISSE, nî'se. A fortified town in the Province of Silesia, Prussia, on the Glatzer Neisse, 46 miles south-southeast of Breslau (Map: Prussia, G 3). The town proper on the right bank of the river is well built, with the interesting Gothic church of St. Jacob, dating from the fifteenth century, the Jesuit church, the church of the Cross, the Rathaus with its high tower, the bishop's residence, now used for municipal offices, and the Catholic Gymnasium, formerly a Jesuit college. The town has a Gymnasium, an archiepiscopal seminary, and a military academy, manufactures tapestry, furniture, machinery, cutlery, lace, and wire screens, and carries on a trade in sugar, wood, marble, and vegetables. Pop., 1900, 24,271; 1910, 25,938. Neisse was formerly the capital of the Principality of Neisse, which belonged to the bishopric of Breslau.

NEISSER, nî's'er, ALBERT LUDWIG SIEGMUND (1855-1916). A German syphilologist. Born in Schweidnitz, German Silesia, he studied at the universities of Erlangen and Breslau (M.D., 1877). From 1878 to 1880 he was assistant at the university clinic at Breslau, in 1880 he was admitted to the medical faculty of the University of Leipzig as privatdocent, and two years later he returned to Breslau as assistant professor, where, in 1907, he was appointed professor of dermatology and syphilis. He traveled through the Scandinavian peninsula and Spain, studying leprosy, and through Java and Batavia. Neisser paid special attention to leprosy, gonorrhea, and syphilis. Upon his discovery of the gonococcus (1879) he based the local treatment of gonorrhea, which is now universally used. His writings treat the fields of leprosy, gonorrhea, and syphilis and amount to more than 100 essays. Among them may be mentioned:

"Weitere Beiträge zur Aetiologie der Lepra" (1881); "Ueber Iodoform Exantheme" (1884); "Ueber die Ansteckungsfähigkeit der chronischen Gonorrhoe" (1886); "Ueber Therapie der Syphilis" (1886); "Ueber die Mängel der zur Zeit üblichen Prostitutenuntersuchung" (1890); "Wann und wie sollen wir die Gonorrhoe behandeln?" (1890); *Die Einreibungskur* (1897); "Ist die Syphilis heilbar?" (1903); *Atlas seltener Hautkrankheiten* (1906-07), with E. Jacobi; "Ueber das neue Ehrlichsche Mittel" (1910); "Bemerkungen zur Lupus Bekämpfung" (1913).

NEITH, nē'ith. One of the most ancient of the Egyptian goddesses, worshiped especially at Sais in the delta. She is mentioned in some of the most ancient inscriptions, but did not attain any special prominence until the time of the twenty-sixth dynasty, which originated in Sais. Neith is represented as a woman wearing the crown of Lower Egypt and holding in her hand a bow and arrows, together with the sceptre of a goddess. In late times it seems certain that she was regarded as a form of Hathor. In earlier times, says Budge, "she was certainly a personification of a form of the great, inert, primeval watery mass out of which sprang the sun god Ra." It is probable that she was originally a Libyan divinity. Consult: Mallet, *Le culte de Neit à Sais* (Paris, 1889); W. M. Flinders Petrie, *Nagada and Ballas* (London, 1896); Alfred Wiedemann, *Religion of the Ancient Egyptians* (Eng. trans., New York, 1897); E. A. T. Wallis Budge, *The Gods of the Egyptians* (2 vols., London, 1904).

NEITHARDT VON GNEISENAU, nî't'härt fôn gnî'ze-nou. See GNEISENAU, AUGUST.

NEITZEL, nî't'sel, OTTO (1852-). A German music teacher and composer, born at Falkenburg, Pomerania. He studied in Kullak's Academy in Berlin and also at the university there (Ph.D., 1875). He became pianist for Pauline Lucca and Sarasate; served as conductor of the Musikverein at Strassburg in 1878-81 and also conducted in the City Theatre there in 1879-81, and taught at the Moscow Conservatory in 1881-85 and thereafter at the Cologne Conservatory. In 1887 he became musical critic of the *Kölnische Zeitung*. His operas, *Angela* (1887), *Didò* (1888), and *Der alte Dessauer* (1889), were fairly successful, and he published *Führer durch die Oper des Theaters der Gegenwart, Text, Musik, und Scene erläutert* (3 vols., 1890-98), *Beethovens Symphonien nach ihrem Stimmungsgehalt erläutert* (1891); *Camille Saint-Saëns* (1899); *Musikästhetische Betrachtungen* (1909), with Ludwig Riemann.

NEIVA, nā'ê-vā. The capital of the Department of Huila, Colombia, on the right bank of the river Magdalena, at the head of navigation for light craft, and 112 miles southwest of Bogotá (Map: Colombia, B 3). It is the chief centre for commerce for south Colombia, is celebrated for its cacao, and has an export trade in cattle. There are minor industries in silk weaving and in the manufacture of hats. Its former trade in cinchona has largely disappeared through the destruction of the trees. Neiva was founded in 1550 and 19 years later destroyed by the Indians. It was rebuilt in 1612 on its present site. Pop., 1912, 21,852.

× **NEJD, or NEDJED, nēj'd.** A region of Arabia, lying between lat. 24° and 27° N. and bounded by El Hasa on the east and Hedjaz on the west (Map: Asia, F 6). It has a hilly

surface, 2500 to 5000 feet, intersected by many streams, which dry up during the summer. The climate is healthful. Politically Nejd is a dependency of Jebel Shammar. The inhabitants are Wahabis and are estimated at 1,000,000.

NEJIN. See NEZHIN.

NEKHET, nĕk'hĕt. An Egyptian deity, the local divinity of the city of Eileithyia (q.v.).

NEKRASOV, nĕ-kra'sŏf, NIKOLAI ALEX-ANDROVICH (1821-78). A Russian poet, born in the Government of Podolia. At 16 he left the Yaroslav Gymnasium and was sent to St Petersburg to enter the Regiment of Nobles. He matriculated at the university in 1839, whereupon his father cast him off. For three years he suffered fearful privations, until a tutorship in a preparatory school and some hack work for periodicals improved his material circumstances. In 1840 he produced a volume of verse which was not well received. He was more fortunate with two prose volumes, published in 1845 and 1846, which met with Belinski's praise. In 1847 he bought the *Contemporary* (*Sovremennik*), which soon became the most popular monthly in Russia. The years between 1856 and 1866 were the most brilliant period in his literary activity. Until then despondent and doubting, he now shared the hopes aroused by the great reform movement. When the *Contemporary* was suspended, Nekrasov edited the *Annals of the Fatherland*. His works depict the downtrodden and oppressed of all classes of Russian society. The racy, idiomatic language of the poet, the vividness of his imagery, and the caustic power of his satire are tremendously impressive. On the other hand Nekrasov is not wholly free from artificiality and exaggeration and is deficient in form. His *Red-Nosed Frost, Fatherland, Peasants' Children, and Last Songs* are among the most touching of his poems. The long poem (5000 verses) *Who Lives Happily in Russia?* written in an unusual metre, is sometimes diffuse in the treatment of the whole life of the whole nation, but the greater part of it is admirable. He died Jan. 8, 1878. His works have been published at St Petersburg in two volumes (10th ed, 1909). Wiener, *Anthology of Russian Literature*, vol. II (New York, 1903), contains a list of English translations of Nekrasov's poems. Consult Rosa Newmarch, *Poetry and Progress in Russia* (New York, 1907, with translations), and the monographs of Pypin (St. Petersburg, 1905) and Pokrovski (Moscow, 1906).

NEKTON, nĕk'tŏn. See PALEONTOLOGY.

NÉLATON, nă'lă-tŏn', AUGUSTE (1807-73). A French surgeon, born in Paris. He received his doctor's degree in 1836, from 1839 until 1851 was adjunct professor in the Faculty of Paris, and from the latter year until 1867 was professor of clinical surgery. In 1866 he became physician to the Emperor and in 1868 a Senator. He was elected a member of the Institute in 1869. Nélaton was one of the most skillful operators of his time, especially in lithotomy, and made several important improvements in surgery, one of which, a probe, having an unpolished porcelain knob at its end, much used in military surgery in searching for bullets, is called Nélaton's probe. His principal work is *Éléments de pathologie chirurgicale* (1844-49; 2d ed., 1868-85). Among his other works may be mentioned *Recherches sur l'affection tuberculeuse des os* (1837).

NELEUS (Lat., from Gk. Νηλεύς). A son of Poseidon and brother of Pelias. Having been

exposed by their mother, the brothers were found and brought up by a herdsman and when grown up were recognized by their mother, Tyro, who had married Cretheus of Iolcus in Thessaly. After Cretheus's death they quarreled over the possession of Iolcus, and Neleus withdrew to Pylos in Messenia. Because Neleus refused to purify Heracles after the murder of Iphitus, Heracles killed all Neleus's sons except Nestor. According to one account Neleus perished with his sons. He is also said to have reestablished the Olympic Games and to have died at Corinth. See also MELAMPUS.

NELIDOV, nĕl'ĭ-dŏf, ALEXANDER IVANOVITCH (1838-1910). A Russian diplomat, member of an old aristocratic family. He was born in the Kishinev District and studied law and Oriental languages at the University of St Petersburg. Entering the diplomatic service (1855), he was secretary successively to the Russian Ambassadors at Athens, Munich, and Vienna and in 1872 was appointed counselor to the Embassy at Constantinople. During the Russo-Turkish War of 1877-78 he directed the diplomatic office at the headquarters of the Russian army and took an active part in the negotiations which led to the Peace of San Stefano and later to the Treaty of Berlin. Nelidov was appointed Ambassador to Saxony (1879). Between 1883 and 1897, while Ambassador to Turkey, he took a prominent part in the settlement of the Armenian question and in the adjustment of the Balkan difficulties and did a great deal to strengthen the influence of Russia at Constantinople. From 1897 to 1903 he was the Russian Ambassador at Rome and from 1903 to his death Ambassador to France. He played a considerable part in settling the famous Hull incident during the Russo-Japanese War.

NELIGH, nĕl'ig. A city and the county seat of Antelope Co., Neb., 153 miles northwest of Omaha, on the Elkhorn River and on the Chicago and Northwestern Railroad (Map Nebraska, G 2). It has a Carnegie library and a beautiful park with a fine bathing beach. The city is the commercial centre of a large agricultural and stock-raising region. Alfalfa, corn, and fruit are extensively cultivated in this vicinity. The industrial establishments include alfalfa and flour mills, a grain elevator, a creamery, cement-block, brick, and chicken-food factories, and marble and granite works. Pop., 1900, 1135; 1910, 1566.

NELLORE, nĕl-lŏr', or **NELLUR,** nĕl-lŏŏr'. The capital of a district, Madras, British India, situated on an elevation on the right bank of the Pennair River, 8 miles from its mouth and 96 miles north-northwest of Madras (Map: India, D 6). It is an irregularly built town, is the seat of several European missions, and has dyeing and rice-husking establishments. One of the features of the vicinity is the ancient, 877 yards long, the chief irrigation work on the Pennair. The town has a good water supply. The ancient Sinhapur (lion city) was formerly an important fortress. The discovery in the ruins of a Hindu temple, at the end of the eighteenth century, of a pot filled with second-century Roman gold coins and medals, chiefly of Trajan, Adrian, and Faustina, would point to a remote origin. Pop., 1901, 32,040; 1911, 33,246.

NEL'SON. A municipal borough and manufacturing town in Lancashire, England, 3½ miles north-northeast of Burnley. Besides coal mining it has considerable manufactures of cotton,

worsted, and silk. It contains a handsome town hall, a market hall, a library, and a technical school. In 1850 it was a small village named after a roadside inn; its manufactures inaugurated its prosperity, and it was incorporated in 1890. It owns its water, gas, and electric-lighting plants, market, and cemetery. Pop., 1901, 32,816; 1911, 39,479

NELSON. The capital of a province of the same name in New Zealand, situated at the north end of South Island (Map: New Zealand, S I., D 2). The harbor has a depth on bar of from 15 to 19 feet. The railway wharf can be reached only by vessels drawing 18 feet and under. Steamers periodically ply to Sydney and Melbourne. The manufactures of the town comprise cloth and leather goods. The centre of the town is a hill rising 40 feet above the surrounding streets and laid out as a square with an Episcopal cathedral in its centre. The city possesses a town hall, art gallery, museum, and several educational institutions of high grade and is the centre of a fruit and hop growing district. The city was founded in 1842. Pop., 1901, 7000, 1911, 9023. The provincial district of the same name contained, in 1911, 48,463 inhabitants.

NELSON. A city and the capital of Kootenay electoral district, British Columbia, situated on the Kootenay River, about 270 miles east (direct) of the city of Vancouver and on the Canadian Pacific and Great Northern railways (Map: British Columbia, E 5). It possesses a business college, an armory, and county buildings. It is the centre for the East and West Kootenay mining district, producing silver, gold, copper, lead, zinc, and coal. It is a divisional point on the Canadian Pacific Railway, which has railway repair shops and shipyards here. Industrial establishments include ironworks, cigar, box, jam, and mattress factories, saw and shingle mills, and manufactories of boats and launches. The city owns its hydroelectric light and power plant, gas and water works, and street railway. Pop., 1911, 4476, 1915, with suburb (local est.), 7500.

NELSON, AVEN (1859—). An American botanist, born in Lee Co., Iowa, and educated at the State Normal School at Kirksville, Mo., at Harvard (A.M., 1892), and at the University of Denver (Ph.D., 1904). He served as an instructor at Drury College, Springfield, Mo., in 1883–85, as principal of public schools at Ferguson, Mo., in 1885–87, and as professor of botany at the University of Wyoming after 1887. Nelson had charge of laboratories at the Columbian Exposition in 1893 and at the Louisiana Purchase Exposition in 1904. His publications include *Report on the Flora of Wyoming* (1896); *The Trees of Wyoming and how to know them* (1899); *Key to Rocky Mountain Flora* (1902); *Spring Flora of the Intermountain States* (1910; new ed., 1912).

NELSON, HENRY LOOMIS (1846–1908). An American economist and journalist, born in New York City. He was educated at Williams College, graduated from the Columbia Law School, and, admitted to the bar in 1869, practiced until 1878. From the latter year until 1885 he was Washington correspondent of the *Boston Post*, of which he was editor in 1885–86, was an editorial writer for the *New York World* in 1889, and served as editor in chief of *Harper's Weekly* in 1894–98. From 1902 until his death he was professor of political science at Williams. He is author of *John Rantoul* (1885), a novel;

Our Unjust Tariff Law (1884); *The Money we Need* (1895); *The United States and its Trade* (1902).

NELSON, HORATIO, VISCOUNT (1758–1805). The most famous of English admirals. He was born at Burnham-Thorpe, Norfolk, England, on Sept. 29, 1758. His father was the rector of his native place, while his mother was a grand-niece of Sir Robert Walpole. Nelson received only a meagre education, and at the age of 12 he entered the navy under the care of his maternal uncle, Captain Maurice Suckling. To this uncle he owed his early rapid promotion and the advice which led to his careful training in seamanship. During his first period of service he made voyages to the Arctic regions and to both the West and East Indies, and suffered considerably from ill health, for throughout life Nelson was very weak physically, and often was maintained only by sheer force of will. In 1777 Nelson was made second lieutenant, and again went to the West Indies. In 1779 he became captain, and henceforth promotion came to him only in due order, since the regulations did not allow any promotion other than according to seniority after the rank of captain.

In 1783, after the war with France and the American Colonies had closed, Nelson was for a short time put on half pay, but after a few months, part of which time was spent in France, he was appointed to the *Borcas*, on which he served in the West Indies until 1787. Here he performed his first notable service, which, however, brought him into conflict with his commander, Sir Richard Hughes, a well-meaning but timid man. Contrary to the latter's orders and in opposition to powerful interests in the West Indies, Nelson insisted upon enforcing the Navigation Acts against the United States and other foreign nations. He was ultimately upheld by the British government, but for the time it involved him in vexatious lawsuits and caused him much anxiety. While on this station Nelson first met at Nevis the widow of Dr. Josiah Nisbet, by birth a Miss Frances Woolward, whom he ultimately married on March 11, 1787, Prince William, afterward William IV, giving the bride away.

Soon after his marriage Nelson started for home, and on Nov. 30, 1787, he was relieved from active service. For some obscure reasons a coolness had sprung up between Nelson and the Admiralty, with the result that he remained in retirement until the threatened outbreak of the war with France in 1792 caused all officers to be recalled into active service. On Jan. 30, 1793, Nelson received command of the 64-gun ship *Agamemnon*, which, together with his last ship, the *Victory*, is most closely associated with his career. He served on it for over three years. He was assigned to the Mediterranean fleet, serving first under Admiral Hood, then under Hotham, and finally under Sir John Jervis (later the Earl of St Vincent). Several times he was sent on diplomatic missions, and on the occasion of one to Naples in September, 1793, Nelson for the first time met Sir William Hamilton and his wife Emma, the Lady Hamilton who was to have later so great an influence over him. Nelson took an active part in Hood's conquest of Corsica, commanding the marines at Bastia and Calvi, where gravel driven by a cannonball destroyed the sight of his right eye. This period of his life Nelson always considered the happiest part of his career, and it prepared

him for the great events to come. In 1796 he was made a commodore and received a new ship.

At this time Napoleon was winning his great victories over the Austrians in Italy. The position of the British fleet in the Mediterranean was becoming precarious, as Spain was about to join France, in which case the English fleet would be greatly outnumbered. The hold of the British on Corsica was loosening, since, under the influence of the great French victories, the Republicans were becoming very active on the island. Taking all these things into consideration, the British government ordered Sir John Jervis to abandon Corsica, to withdraw from the Mediterranean, and return to England. These orders were received on Sept. 25, 1796, and Nelson had to superintend the work, though he considered it best for Great Britain to retain everything, since he believed the British fleet sufficiently powerful to cope with the enemy.

In December, 1796, Jervis sent Nelson back to the Mediterranean to aid in the removal of the naval stores from the island of Elba, which the British had retained at the time they had abandoned the other posts in that sea. As he was returning he had to pass through the whole Spanish fleet, and on Feb. 13, 1797, he had rejoined Jervis. The following day took place the great battle off Cape St Vincent (q.v.). Here by his rapid and independent manœuvres Nelson did much to carry the day, and Jervis was magnanimous enough to give him due credit. The Spanish fleet of 27 ships was totally defeated by 15 vessels, and one of the chief naval resources of France had disappeared. As a reward for his share in this great event Nelson received a knighthood of the Bath, and before this he had become in due order of promotion a rear admiral of the blue. His next duty was to bring the troops away from Elba, a task which he promptly accomplished. It is interesting to note that though at this time the serious mutinies in the fleet at Spithead and the Nore took place, Nelson had no difficulty with his men, who assured him of their loyalty. For a few weeks Nelson served off Cadiz, and then, at his own suggestion, he was detached to make an attack on the town of Santa Cruz, on the island of Teneriffe, believing that large Mexican treasure ships had taken refuge there, whose capture would deal a severe blow to Spain. The expedition arrived at its destination on July 20, 1797, and the following day an attack was made. This assault and some later ones were all repulsed. The plan had never anything to recommend it but its boldness and a belief that the place was not strongly defended. Nelson himself fought with great heroism and lost his right arm, and, as the wound did not heal well, he was compelled to return to England, where he arrived Sept. 3, 1797. On September 27 he was invested with the Order of the Bath by George III in person, and at the same time a pension of £1000 a year was awarded him. At this time, on account of his ill health and a fear that he would never again be able to enter active service, his spirits were greatly depressed, but he revived at once when on March 29, 1798, his flag was again hoisted over a ship. On April 29 he rejoined the Earl of St. Vincent off Cadiz.

From this time a new period in Nelson's life begins. He soon becomes the great man of his service, instead of merely one of many distinguished naval officers. It is the period which

opens with Abukir Bay and closes with Trafalgar. It is necessary to consider now the state of Europe at the time when Nelson rejoined the fleet. Austria had been compelled by Napoleon's victories in Italy to sign the Preliminaries of Leoben on April 18, 1797, which were ratified soon after by the Treaty of Campo-Formio (q.v.). This left England with only one weak ally, Portugal, while it set Napoleon free to attack England itself. He thought the best place to injure England would be in the East, and for this purpose prepared his great Egyptian expedition (See NAPOLEON I.) The news of Napoleon's intentions soon reached St Vincent, and in spite of the jealousy of some older officers, he detached Nelson to watch the French fleet and to check it. Nelson was unable to prevent it from getting to Egypt, and for months there was a weary hunt to find the French ships and compel them to fight. Finally, on Aug. 1, 1798, Nelson discovered them in the Bay of Abukir, and in the battle of the Nile that ensued the French fleet was completely defeated, and only two vessels escaped. Nelson received a wound on the head from which he suffered ever after. The brilliant victory practically insured the failure of Napoleon's expedition, since it cut him off from his base of supplies. Nelson was created Baron Nelson of the Nile, and received a pension of £2000 a year, besides other numerous gifts and compliments both from England and abroad. On August 19 he sailed from Alexandria and on September 22 he finally arrived at Naples.

The Neapolitan period of Nelson's life, which covered the ensuing two years, was the principal blemish on his career. Here began his criminal relations with the wife of the English Minister at Naples, Sir William Hamilton, which led to a complete separation of Nelson and his wife early in 1801. Moreover, Lady Hamilton influenced Nelson's public acts, so that for a time he behaved rather as commander in chief of the Neapolitan navy than as an English admiral. He induced Naples, however, to make war upon France, but the Neapolitan army was soon decisively defeated, and the royal family was compelled in December, 1798, to leave Naples, where the French proclaimed the Parthenopean Republic. After residing for a while with the Hamiltons at Palermo, and vexed for a time on account of the appointment of a junior officer, Sir Sidney Smith, to an important command in the Levant, Nelson was finally roused again to action on May 12, 1799, by the news that Admiral Bruix with the French Brest fleet had escaped from that harbor and was about to enter the Mediterranean. The danger was imminent that the French would recover the naval supremacy in the Mediterranean, which had been destroyed by the victory at Abukir Bay. Nelson prepared for the emergency with his usual ability, when, to his disgust, Jervis resigned his command and was succeeded by Keith, an honest but by no means brilliant officer. Friction between him and Nelson existed from the start. On June 24, 1799, Nelson appeared before Naples, intent upon securing that city before the French fleet should appear. He found that the Republicans had complete control and were aided by a Neapolitan squadron under Commodore Caraccioli. The Neapolitan admiral was captured on June 29, and Nelson, as commander in chief of the Neapolitan navy, immediately ordered a court-martial,

which sentenced the Commodore to death, and he was executed at once. Nelson has often been blamed for this action—for not keeping within his proper jurisdiction as the representative of Great Britain, and for not proceeding with more deliberation. The forts of the city had surrendered on June 26. At this time Nelson was created Duke of Bronte by the despicable Ferdinand IV of Naples. To the influence of Lady Hamilton, who was the intimate of the Queen of Naples, must be charged the serious disobedience of orders by Nelson shortly after. He had been ordered to join Lord Keith and to assist him to meet a large French fleet, but he preferred to remain at Naples. The danger, it is true, was averted, for on Aug. 13, 1799, the French fleet reentered Brest, but had Nelson come up in time it is just possible that another great victory might have been won. For a short time Nelson was commander in the Mediterranean, but he displayed no enthusiasm for his work. On Jan. 20, 1800, he united his command with that of Keith, and after several quarrels Nelson was finally recalled by orders which reached him in June. He traveled overland with the Hamiltons, and, though he was received everywhere with great enthusiasm, his conduct gave great cause of scandal to his friends. On Nov. 6, 1800, the party arrived in England, and soon after Nelson's final breach with his wife took place.

On Jan. 1, 1801, Nelson became vice admiral by seniority and was assigned to the command of Sir Hyde Parker, who was to coerce the Northern Confederation. This league, composed of the states on the Baltic, had been maintaining an armed neutrality, which in truth was only a veiled attempt to aid Napoleon. Nelson advised an attack on the strongest member of the confederacy, Russia; but his daring plan was not followed, and instead the whole fleet sailed for Denmark. In a bold assault on the Danish fleet at Copenhagen, Nelson was victorious (April 2, 1801), and the Danes were compelled on April 9 to sign an armistice, which tied their hands, but left the English free. It was during the engagement of April 2 that Nelson, having received an order early in the day to cease action, placed his telescope to his blind eye and said, "I really do not see the signal." On May 5, 1801, Nelson was appointed commander in chief in place of Parker. He immediately proceeded to carry out his plan of attacking Russia, but found, when he arrived at Revel, that the Czar Paul had been murdered on March 24, and his son and successor, Alexander I, was preparing to follow another policy. For his services in this campaign Nelson was created Viscount. He returned to England and lived with the Hamiltons. After some slight service in the Channel, the Peace of Amiens closed the war, and on Oct. 22, 1801, Nelson left his ship.

Peace, however, proved of short duration, and on May 18, 1803, Nelson raised his flag on the *Victory* as commander in chief of the Mediterranean fleet. For two years he blockaded Toulon and kept a watchful eye on affairs, but Villeneuve escaped from Toulon with the French fleet on March 30, 1805. Napoleon was preparing at Boulogne to invade England, and for this purpose the different French fleets were to unite and cover the expedition. A most exciting chase followed, in which Nelson pursued Villeneuve to the West Indies and back to the coast of Spain, but the French admiral was unable to

elude Nelson and the other English admirals long enough to give Napoleon any opportunity of crossing the Channel. Villeneuve finally put in at Cadiz, and Napoleon marched against Austria, which had declared war against him. Thus England was saved.

Nelson now blockaded Villeneuve at Cadiz, but Napoleon was threatening to disgrace his admiral for not fighting, and consequently, when Nelson had to send six vessels to Gibraltar for water, Villeneuve seized the opportunity and started to leave his shelter on Oct. 19, 1805, and on October 21 took place the famous battle off Cape Trafalgar (q.v.). Before beginning battle Nelson gave his now famous signal, "England expects that every man will do his duty." The victory was complete, but Nelson was mortally wounded, and died on the afternoon of Oct. 21, 1805, with the words "Thank God, I have done my duty." By his final great victory he had destroyed the combined French and Spanish fleets, and Napoleon's hope of creating a naval power vanished forever. Nelson thus contributed immensely to the final destruction of the Napoleonic ambitions, for without the control of the sea England would have been unable to wage her long contest. Nelson was buried in St. Paul's Cathedral, London, on Jan. 9, 1806, amid extraordinary public demonstrations, and in 1849 an imposing monument to his memory was completed in Trafalgar Square.

Bibliography. For many years the standard biography of Nelson was that by Robert Southey, popular and unreliable, first published in 1813, with many later editions, a good one being in *Everyman's Library* (New York, 1908), which contains a bibliography; this has been superseded by the sympathetic and reliable work by A. T. Mahan, *The Life of Nelson, the Embodiment of the Sea Power of Great Britain* (Boston, 1899). Consult also J. K. Laughton, *Letters and Despatches of Horatio, Viscount Nelson* (London, 1886), J. C. Jeaffreson, *Lady Hamilton and Lord Nelson* (ib., 1888), id., *The Queen of Naples and Lord Nelson* (ib., 1889); G. L. Browne, *The Public and Private Life of Horatio, Viscount Nelson, as Told by himself, his Comrades, and his Friends* (ib., 1891), W. H. Fitchett, *Nelson and his Captains* (ib., 1902); J. K. Laughton, *Nelson* (ib., 1904); id., *Nelson and his Companions in Arms* (ib., 1905); White and Moorhouse, *Nelson and the Twentieth Century* (ib., 1905), M. E. Matcham, *The Nelsons of Burnham Thorpe. Compiled from Unpublished Letters and Notebooks* (ib., 1911); E. H. Moorhouse, *Nelson in England: A Domestic Chronicle* (New York, 1913).

NELSON, KNURE (1843—). An American lawyer and legislator, born near Bergen, Parish of Voss, Norway. After his father's death he was brought by his mother to the United States in 1849. The family settled first in Chicago, the next year moving to Wisconsin. Nelson attended the Albion Academy; fought in the Civil War, being wounded and taken prisoner at Fort Hudson, La.; was admitted to the bar in 1867. During the next two years he was a member of the Wisconsin Legislature. After removal to Alexandria, Minn. (1871), he was for three years attorney for Douglas County, State Senator (1875-78), and presidential elector (1880). Elected to the Federal House of Representatives in 1882 and twice reelected, Nelson showed his independence of party control by voting for both the Mills and

the Morrison tariff bills, although they were Democratic measures. On his retirement and resumption of practice, he became interested and employed in numerous complicated land cases, and he later prepared exhaustive treatises on the law governing public lands. In 1892 he was elected Governor of Minnesota, and in 1894 he was reelected with increased plurality, having had a conspicuously successful administration. Before the end of his second term he was selected to succeed W. D. Washburn as United States Senator, and he was reelected in 1900, 1906, and 1912. As Senator, Nelson soon took standing as one of the foremost Republican leaders. Probably his most important contribution to legislation was the act creating the Department of Commerce and Labor.

NELSON, REUBEN (1818-79). An American Methodist Episcopal clergyman, educator, and publisher, born at Andes, N. Y. He entered the ministry in 1842. From 1840 to 1844 he was principal of Otsego Academy at Cooperstown, N. Y., and then, except for a year when he was presiding elder, for 28 years was the first principal of Wyoming Seminary, at Kingston, Pa. In 1872 he was elected one of the agents of the Methodist Book Concern in New York, and treasurer of the missionary society of his church, continuing to serve in both positions until his death. He was secretary of the Wyoming (Pa.) Conference for 10 years and a member of several General Conferences.

NELSON, SAMUEL (1792-1873). An American jurist, born at Hebron, Washington Co., N. Y. He graduated at Middlebury College, Vermont, in 1813. He then read law, removed to New York State, where in 1817 he was admitted to the bar, and began practice at Cortland. In 1820 he was a presidential elector on the Democratic ticket. His long judicial career of half a century began in 1823, when he was appointed by Governor Yates a judge of the State Circuit Court. In 1831 he was promoted to be an associate justice of the New York State Supreme Court, and in 1837, by appointment of Governor Marcy, he became Chief Justice of the court in succession to Judge Savage. In 1845 he was nominated by President Tyler as an associate justice of the Supreme Court of the United States. Although he concurred with Chief Justice Taney in the "Dred Scott" decision in 1857, and disapproved of the President's exercise of "war powers" during the Civil War, his loyalty was never questioned, and he was frequently consulted by Lincoln in judicial matters. He ranks as one of the greatest American authorities on admiralty and maritime law, and his prize-court decisions during the Civil War are of the utmost importance. In 1871 he was appointed by President Grant as one of the Joint High Commission for the settlement of the Alabama claims (q.v.).

NELSON, THOMAS (1738-89). An American patriot, one of the signers of the Declaration of Independence. He was born at Yorktown, Va., and was the son of William Nelson, Governor of Virginia in 1770-71. He went to England in 1753, was educated at Eton and at Trinity College, Cambridge, and returned to his home at Yorktown in 1761. He was a delegate for several terms to the House of Burgesses, and served in the Provincial Conventions of 1774, 1775, and 1776, introducing in the last the resolution by which Virginia's delegates to Congress were instructed (May 15) to propose a

declaration of independence. From August, 1775, until May, 1777, when he was forced by ill health to resign, he was a delegate to the Continental Congress, and signed the Declaration of Independence. In 1775 he was for a time colonel of the Second Virginia Regiment, and from August, 1777, until late in 1782, he commanded the Virginia State forces, rendering valuable service at the siege of Yorktown (1781), where he showed his patriotism by ordering the gunners to fire upon his own mansion, supposed to be the headquarters of Cornwallis. In 1779 he again sat for a time in Congress, and was again forced by ill health to resign; in 1780 he raised a large sum of money, on his own security, for the State, and paid out of his own pocket the arrearages of two Virginia regiments ordered South, and in the spring of 1781 he succeeded Jefferson as Governor of Virginia, though he resigned in November. Impoverished by his liberal advances to the State during the war, he passed his last years in very straitened circumstances, and much of his property was sold to pay public debts, for which he was security.

NELSON, WILLIAM (1825-62). An American naval officer and soldier, born in Maysville, Ky. He entered the United States navy in 1840, and in 1847 commanded a battery at the siege of Vera Cruz. He subsequently served in the Mediterranean and South Pacific, was promoted to the rank of master in 1854 and to that of lieutenant in 1855, and in 1858, as commander of the *Niagara*, transported to Africa the negroes who had been rescued from the slave ship *Echo*. In 1861 he was on ordnance duty at Washington, and at the outbreak of the Civil War he was placed in command of the gunboats on the Ohio, with the rank of lieutenant commander. He left the navy soon afterward, entered the military service, was ordered to Kentucky, and there established recruiting stations, and organized camp Dick Robinson, near Danville, and a similar rendezvous at Washington, in Mason County. In September, 1861, he became a brigadier general of volunteers, and at the battle of Shiloh (April 6-7, 1862) he commanded the second division under General Buell (See SHILOH, BATTLE OF). He was wounded in the engagement at Richmond, Ky.; was in command at Louisville, Ky., in 1862, when the Confederate general Bragg threatened that city, and in July of this year was commissioned major general of volunteers. On September 29 he was fatally shot at the Galt House, Louisville, by the Federal general Jefferson C. Davis, in a personal quarrel.

NELSON, WILLIAM ROCKHILL (1841-1915). An American newspaper proprietor and editor, born at Fort Wayne, Ind. He was educated at Notre Dame University, Indiana, studied law, and was admitted to the bar. In 1876 he was campaign manager of Samuel J. Tilden in Indiana. He accumulated a fortune of \$200,000 as a contractor, but lost most of it in an unfortunate cotton-growing enterprise in Georgia. An interest which he had acquired in the Fort Wayne *Sentinel* in 1876 he sold four years later, and then founded with S. E. Morss, who retired a few months later, an evening daily, the *Kansas City Star*. In 10 years the *Star* had a daily circulation of 50,000, and under Nelson's personal direction and editorship it came to have considerable influence throughout the country. When the *Kansas City Times* failed in 1901,

Nelson bought that paper and continued it as a morning edition of the *Star*. The two papers soon reached a combined circulation of 200,000, under a policy which Nelson himself described as "independent, but never neutral."

NELSON, WOLFRED (1792-1863). A Canadian physician and political leader. The son of an English officer, he was born at Montreal. In 1811 he began the practice of medicine in St. Denis. In the war with the United States (1812-14) he served as surgeon. In 1827 he was elected Reform member for the Borough of William Henry in the Legislative Assembly of Lower Canada, where he labored faithfully to secure constitutional redress of the political grievances under which the people of that province suffered. Yielding later to the influence of L. J. Papineau (q.v.), he took a leading part in the rebellion of 1837, and was in command at the victory obtained by the insurgents at St. Denis, on the Richelieu River, but was captured and banished to Bermuda by Lord Durham (q.v.). Released in October, 1838, after the British government had declared Durham's decree of banishment illegal, Nelson settled at Plattsburg, N. Y., in the same year, and in 1842, after the declaration of a general amnesty, returned to Montreal. He was elected for Richelieu County to the Legislative Assembly of Canada in 1844 and 1845, and in 1851 was made inspector of prisons, a position which he held for several years. He served as mayor of Montreal two terms, and was at the head of the Lower Canada College of Physicians and Surgeons. Nelson was for many years a contributor to the medical press of Canada and the United States. He died in Montreal. Consult J. C. Dent, *Canadian Portrait Gallery* (1880), and *Canada since the Union of 1841* (Toronto, 1881).

NELSON RIVER. The principal river in the Province of Manitoba, Canada, forming the lower course of the Saskatchewan (q.v.) (Map: Canada, L 5, M 5). It flows from the north end of Lake Winnipeg at Norway House, first northward, through a series of lakes, then northeastward, into Hudson Bay at Port Nelson and York Factory, emptying through the estuary of Port Nelson after a course of about 400 miles. It is deep, wide, and swift, discharging an enormous volume of water; rapids and falls in its upper reaches limit its navigation by steamers to from 80 to 90 miles, though boats can ascend 127 miles from its mouth.

NELSON'S FARM, BATTLE OF. See FRAZIER'S FARM, BATTLE OF.

NELSON'S MONUMENT. A granite column in the centre of Trafalgar Square, London, copied from a Corinthian column of the temple of Mars Ultor, in Rome, and crowned with a statue of Nelson, 17 feet in height, by Edward H. Baily (q.v.). The shaft, 145 feet high, was erected in 1843 by voluntary subscriptions. The pedestal bears bronze reliefs, cast from French cannon, depicting scenes from Nelson's life. At the foot of the column are four colossal bronze lions, by Sir Edwin Landseer.

NELSONVILLE. A city in Athens Co., Ohio, 62 miles by rail southeast of the State capital, Columbus, on the Hocking River and on the Hocking Valley Railroad (Map: Ohio, F 7). There is an important trade in coal, which is mined extensively in the vicinity, this being one of the most productive coal fields of the State. Nelsonville has brick, sewer-pipe,

and clay works, and a large establishment which manufactures mining implements, car wheels, etc., and carries on a large repair business. The water works and electric-light plant are owned by the city. Pop., 1900, 5421; 1910, 6082.

NELUMBO (Ceylonese name). A genus of aquatic plants similar to water lilies, belonging to the family Nymphaeaceae. The few species are found in the warm parts of Asia, North America, and the north of Africa. *Nelumbo nucifera*, with rose-colored flowers, is the Egyptian bean of Pythagoras, the lotus (q.v.) held sacred by the Hindus and by the people of Tibet, has been used as a food by the Egyptians from remote antiquity, and is much esteemed where it is cultivated, especially in China, for its edible seeds, roots, leafstalks, and flower stalks. The seeds resemble acorns in size and shape and have more delicate flavor than almonds. The root contains much starch, and Chinese arrowroot is said to be obtained from it. Great quantities are pickled with salt and vinegar and eaten with rice. When powdered, it makes excellent soup with water or milk. The ancient Egyptian mode of sowing this plant, by inclosing each seed in a ball of clay and throwing it into the water, is practiced at the present day in India. *Nelumbo lutea* is a North American species, with yellow flowers, which extends as far north as Ontario. The edible seeds, called water chinquapins, are sought for by children and others, and the farinaceous roots are agreeable when boiled. See Plate of AQUATIC PLANTS.

NEMAGRAPTUS, nēm'a-grāp'tūs (Gk. *nēma*, thread, from Gk. *veiv*, to spin + Gk. *grapros*, *graptos*, written on, marked). A genus of graptolites, including the forms earlier known as *Cenograptus* and *Stephanograptus*, found in fossil condition in the early Ordovician shales, especially the Normanskill, and of worldwide distribution. It possesses a sigmoidal curved main stem from which numerous branches diverge, a form very graceful in outline. Its principal species is *Nemagraptus gracilis*.

NEMA'LION (Gk. *nēma*, thread, from Gk. *veiv*, *nem*, to spin + *-lion*). A genus of the red algae (Rhodophyceae, q.v.), including marine forms, usually branching filaments, much simpler in structure and in life history than most of the red algae. For this reason it is a very common form described in textbooks and used in laboratories.

NEMATHELMINTHES (Neo-Lat. nom. pl., from Gk. *nēma*, thread + *ēlms*, *helmins*, worm). A large and important phylum of the unsegmented worms, of a more or less elongated cylindrical form and known as roundworms. Their skin is thick and strong and is usually wrinkled, giving the body a slightly annulated appearance, which, however, disappears if the animal is placed in water. The nervous system in the higher forms consists of two lateral ganglia at the anterior extremity, which are united by a nervous ring, and from which two nervous trunks, one dorsal and one ventral, proceed to the posterior part of the body. In the lower forms the dorsal cord is wanting, or else the ventral cord is wanting and there are two lateral cords. Special organs of sense are rarely met with; but a general sense of touch exists, and a few of the free-living species have two simple eyespots. The digestive organs are extremely simple. No blood system

nor distinct respiratory or excretory organs can be detected. These worms are unisexual, but the males are comparatively rarely found and are always smaller than the females. With the exception of the two families—the Enophidæ, which are mostly marine forms, and the Anguillulidæ, or paste and vinegar eels—all the animals of this class are parasitic.

This phylum is divisible into three very distinct classes, viz., Acanthocephala, which have a protrusile proboscis armed with continuous hooks and are destitute of an intestinal canal; the Gordiacea, which possess an intestinal canal, but no anus; and the Nematoda, which usually possess a perfect intestinal canal, provided with two orifices. See ASCARIS; ENTOZOA; FILARIA; GUINEA WORM; PINWORM; ROUNDWORM; THREADWORMS; TRICHINA.

NEMATOCYST (from Gk. *νήμα*, *nēma*, thread + *κυστίς*, *kystis*, bladder). One of the lasso cells, thread cells, or netting organs (*cnidæ*) of jellyfishes and other Cœlenterata, acting as organs of offense and defense. These bodies are embedded in the outer cellular layer or ectoderm of cœlenterates. A nematocyst is an oval, tough capsule, filled with a clear fluid, and invaginated at one end in the form of a hollow process which is prolonged into a long, coiled, hollow thread. The entire structure is developed in an interstitial cell called a cnidoblast, which, as it approaches maturity, migrates towards the surface and becomes embedded in one of the large ectoderm cells. At one point on its surface the cnidoblast is produced into a delicate protoplasmic process, the cnidocil or trigger hair. Any small animal on coming in contact with the lasso cells of a jellyfish is stung, benumbed, or poisoned by them. Upon contact with one or many of these lasso cells in the tentacles of a jellyfish or hydra, or a physalia, the cnidoblast suddenly contracts, and the pressure upon the stinging capsule causes an instantaneous eversion of the thread, at the base of which are minute sharp barbs. The threads also convey a poisonous fluid, which benumbs the victim. In this way sea anemones and coral polyps obtain their food, paralyzing and thus capturing quite large animals, even young fishes. These poison lasso cells also occur in certain Protozoa, mollusks, and in sponges, and in a modified form exist in the skin of certain worms, both terrestrial and aquatic. In these worms they are minute stiff rods, either coiled up in an irregularly spiral manner, or short and straight, contained in oval cells. They are shot out in great numbers when the animal is irritated, but are not retractile, being projected clear from the skin. That they are true netting organs is proved by the fact that on touching the worms with the tongue they cause a tingling sensation. See illustration under CœLENTERATA.

NEMATODA. A class of the phylum Nematelminthes (q.v.), mostly parasites, but many others are extremely abundant in both fresh and salt water. They are the roundworms (q.v.), and a familiar example is found in *Ascaris* (q.v.). They are ranked in two orders—Nematodea, in which the cœlom is not lined by epithelium, and Gordioidea, in which it is so lined. See HAIRWORM; NEMATHELMINTHES.

NEMATOGNATHI (Neo-Lat. nom. pl., from Gk. *νήμα*, *nēma*, thread + *γνάθος*, *gnathos*, jaw). An order of fishes. See CATFISH. Cf. PLECTOSPONDYLI.

NEMATOPHYTON, nēm'a-tōf'i-ton (Neo-Lat., from Gk. *νήμα*, *nēma*, thread + *φυτόν*, *phyton*, plant). A gigantic fossil alga found in rocks of Devonian age in the eastern United States and Canada. The stem is of great size, often 40 feet long by 2 to 3 feet in diameter, and resembles the trunk of a tree to such extent that it was originally supposed to be the trunk of a conifer. This resemblance led Dawson to name it Prototaxites, or ancestral yew tree. The cellular structure is that of an alga. Several large trunks were uncovered near Monroe, Orange Co., N. Y., during 1897 to 1899. The type species is *Nematophyton logani*.

NEMAUSUS. An ancient town of Gallia Narbonensis, now Nîmes (q.v.).

NĚMCOVÁ, nyēm'tsō-va, BOŽENA (1820-62). A Czech novelist, born in Vienna. She lived in Bohemia for many years, making a study of the life in its villages. The privations she had to endure for the last 10 years of her life do not seem to have dimmed her optimism or benevolence. *Babůčka* (Little Grandmother, 1855) is especially well known. It has frequently been translated into foreign languages, and was translated into English by Gregor in 1891. Her other works include *Chydlí lidé* (Poor Folks, 1857); *Karla* (Charlotte, 1856); *Pohorská vesnice* (The Village in the Mountains, 1856). Her contributions to the study of Bohemian and Hungarian folklore in the volumes *Národní báchorky a pověsti* (1845-46) and *Slovenské pohádky a pověsti* (Slovak Folk Tales, 1858) are valuable. Her complete works, *Sebrané spisy*, were published in 1862-63. Consult Jakubec, *Geschichte der böhmischen Literatur* (Leipzig, 1907).

NĚMEA (Lat., from Gk. *Νημέα*). The ancient name of a well-wooded valley of Argolis, in the Peloponnesus, between Cleonæ and Phlius. It lies north and south and is from 2 to 3 miles long and more than ½ mile broad. In it there was no town, but a sacred inclosure and temple of Zeus, of which three columns are still standing, while the others lie where they have been thrown by earthquakes. The valley was the seat of one of the four great national festivals of the Greeks—the Nemean Games, which were celebrated in midsummer every two years, at the beginning of the second and fourth years of each Olympiad. The first set of games in the historical period seems to have been held in 573 B.C., though legend ascribed the foundation of the games to the seven heroes on their march against Thebes, or to Hercules. The games consisted of the usual athletic contests, horse racing, and a competition for players on the cithara. The prize was a palm branch and crown of parsley. Consult E. N. Gardiner, *Greek Athletic Sports and Festivals* (London, 1910).

NEMEAN GAMES. See NĚMEA.

NĚMERTINEA (Neo-Lat., from Gk. *Νημερτης*, *Nēmertēs*, name of a Nereid, from *νημερής*, *nēmertēs*, unerring, from *νη*, *nē*, not + *αμαρτάνειν*, *hamartanein*, to miss). A class of flatworms easily distinguished from the Platyodes by the proboscis and the presence of an anus. They are also remarkable for the prodigious length attained by some of the species, which, in the most extended state, is 10 or 12 feet, and one (*Linus longissimus*) reaches 90 feet. But the animal which so stretches itself out is capable of suddenly contracting itself to a quarter of that length. The nemertineans are

unsegmented worms, with a ciliated body epithelium, and are more or less dorsoventrally flattened. There is no distinct body cavity; the intestine is straight, with lateral diverticula, the anus is at the posterior end of the body. The blood, nervous, and excretory systems are all present and are usually very well developed. The only sense organs are little ciliated pits, possibly olfactory, and pigment eyes. The sexes are separate, and the larva goes through a complicated metamorphosis in most cases. One of the characteristic features of the nemertineans is the proboscis, lying above the oesophagus and opening from its cavity, just over the mouth. This proboscis may be used in the capture of food, which consists, to a large extent, of other sorts of worms. These worms twine themselves into knots and rolls, apparently inextricable, but without any real entanglement. A large number of species are known from all parts of the world. The great majority are marine, but a few are fresh-water, and land forms are known. The latter are all small and dull-colored, but the marine forms, besides being oftentimes very large, are frequently very gaudy, red and green being common colors. These worms usually pass through a metamorphosis; the prelarva is called a pilidium,

PILIDIUM OF NEMERTES

The worm is shown growing within the larva: *e*, velum; *e*, eyes, *t*, intestine of the nemertean worm.

which is helmet-shaped, with side lobes or lappets. A reduced form of the pilidium is called Desor's larva. The body of the pilidium is not entirely absorbed by the growing worm, but the worm develops within the larva, and finally frees itself, when the remnant of the pilidium dies. Certain forms have a direct development. Multiplication by transverse fission is frequent. Consult Shedson, in *Cambridge Natural History*, vol. ii (London, 1901).

NEMESIANUS, MARCUS AURELIUS OLYMPIUS. A Carthaginian Latinist of the latter half of the third Christian century. He wrote poems called *Halieutica* (on fishing), *Nautica* (on aquatics), and *Cynegetica* (on hunting), of which the 325 lines preserved constitute what is apparently an introduction to the main work (edited by Baehrens in his *Poetae Latini Minores*, vol. iii, 1881, and by Stern, together with Grattius Faliscus, q.v., 1832), and four *Eclogae*, reminiscent of Vergil, of Manilius, and most of all of Calpurnius Siculus, with whose poems they are so constantly found in manuscript that they long passed as his work (edited

by Baehrens, as above, and by Schenkl, 1885; translated into English verse by Scott, 1891). The fondness of the author for the refrain and other points of similarity in style have suggested the attribution to Nemesianus of the *Pervigilium Veneris*; but this is entirely problematical. Consult W. S. Teuffel, *Geschichte der römischen Literatur*, vol. iii (6th ed., Leipzig, 1913).

NEMESIS (Lat., from Gk. *Némeis*, from *némeiv*, *nemein*, to distribute. Others connect with Gk. *νemesi'sthaí*, *nemesizesthai*, to feel just anger). A goddess of fate, who apportions to men their deserts. In Homer Nemesis does not appear as a person, though the word is used as a common noun in the sense of 'righteous anger,' a sort of personification of justice divine. In another early epic, the *Cypru* (q.v.), Nemesis was a goddess beloved by Zeus, whom she sought to escape by transforming herself into various animals. Finally the god approached her as a swan, and she brought forth an egg, which was found and kept by Leda, till in fullness of time Helen, the cause of the Trojan War, was born. Nemesis was worshiped at Smyrna in Ionia, where there seem to have been two goddesses of the same name, and especially at Rhamnus in Attica, where were two temples, an old one and a large new one erected in the period following the Persian wars. It contained a famous statue of the goddess by Agoracritos, the pupil of Phidias, of which the head is in the British Museum. According to Hesiod, Nemesis was the daughter of destructive night. She is the avenger of wrong, punishing especially vaunting pride, and in general any overstepping of the bounds of due moderation. Those who forget to humble themselves before the gods or who offend against the eternal laws are likely to fall under her power. In Alexandrian poetry Nemesis is frequently invoked to punish a cold or fickle loved one. At Rome, too, Nemesis was worshiped, e.g., by victorious generals and by gladiators. In art Nemesis appears as a dignified youthful figure, bearing frequently a measuring rod or an apple branch in one hand, and commonly drawing forward the upper seam of her tunic. In later art she is frequently winged, with a wheel at her feet, or a griffin at her side, or holding a bridle or a sword or a scourge. Consult. H. Posnansky, "Nemesis und Adrasteia," in *Breslauer philologische Abhandlungen*, vol. v (Breslau, 1890); L. R. Farnell, *The Cults of the Greek States*, vol. ii (Oxford, 1896), the article "Nemesis," in W. H. Roscher, *Lexikon der griechischen und römischen Mythologie*, vol. iii (Leipzig, 1897-1909); P. E. More, "Nemesis, or the Divine Envy," in *The New World* (New York, 1899); Georg Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912).

NEMESIUS (Lat., from Gk. *Neméios*, *Nemesios*). A Greek philosopher of the latter half of the fourth century A.D. He was Bishop of Emesa in Syria and wrote in Greek a treatise on *The Nature of Man*, an anthropological work combining Christian views with ideas gained from the Greek philosophers, especially Plato, in which he expressed his belief in the pre-eminence of the soul, the freedom of the will, and the indestructibility of matter. There is a passage in the book which has been interpreted as showing some understanding of the circulation of the blood. In Latin translation the work was much read during the Middle

Ages, and since then it has been translated into several of the languages of modern Europe. There is an edition by Matthaei (Halle, 1802). Consult Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii, part ii (5th ed., Munich, 1913).

NĚMETI, SZATMÁR-. See SZATMÁR-NĚMETI.

NEMI, nā'mě. A beautiful lake in Italy, about 17 miles southeast of Rome, having on its margin a famous grove of Diana, east of the Alban Lake. It was anciently called Lacus Nemorensis and also Speculum Dianæ (Mirror of Diana). The grove of Diana was celebrated on account of its priest, who won his place by slaying his predecessor and held it till he was himself slain. The grove seems to have been situated on the northeast shore, near the modern village of Nemi. In the grove was a splendid temple (98 feet by 52); excavations made in the seventeenth and nineteenth centuries, and especially in 1905, have laid bare the temple and yielded many coins, ex-voto statuettes, inscriptions, etc. The lake fills the crater of an extinct volcano, is about 1100 feet above the sea, 4 miles in circumference, and has no outlet except a passage, 2 miles long, of unknown antiquity, which still serves its original purpose. It had long been known that there were remains of vessels sunk near the shore, but it was not till 1895 that these were satisfactorily examined. One seems to have been about 210 feet in length and 65 feet beam; the other measured 233 feet by 80. The decks were paved with thin slabs of porphyry and serpentine, and the railings were of gilded bronze. Lead water pipes with the name of Caligula furnished a clew to the date and seemed to imply fountains on board. Bronze beam heads and heads of lions, wolves, and a Medusa, with rings in their mouths for hawsers, have been recovered from these structures and removed to Rome. Though commonly called ships, it is far more probable that they were great rafts or boathouses used in some spectacle connected with the worship of Diana. Consult, for the antiquities, *Notizie degli Scavi* (Rome, 1895-96) and *Rivista Marittima* (1896-97). On the ritual of the grove, consult J. G. Frazer, *The Golden Bough*, parts i-iii (3d ed., New York, 1911).

NĚM'OREN'SIS LA'CUS. See NEMI.

NEMOURS, ne-mōōr', DUKE OF. See family article FOIX.

NEMOURS, LOUIS CHARLES PHILIPPE RAPHAEL D'ORLÉANS, DUKE DE (1814-96). Second son of Louis Philippe. He was born in Paris and educated at the College of Henry IV. In 1831 he was elected King of the Belgians, but declined the offer. He served in the two Belgian campaigns and in Algeria and was in 1837 made lieutenant general. After the death of his elder brother, the Duke of Orléans (July 13, 1842), it was proposed to confer the regency upon the Duke de Nemours; but this was not sanctioned by public opinion, and he left France on the outbreak of the revolution in 1848 and did not return till 1871. After the adoption of the antiroyalist bill of 1886 his name was struck off the army list.

NENADOVITCH, nēn'a-dō'vich, **MATEYA** (1777-1854). A Servian patriot. In 1793 he became a priest and later archpriest, or prota, of Valyevo, and hence is called Protá Mateya by Servians. When the Dahis, or leaders of the Janizaries, murdered Alexa Nenadovitch, the father of Protá Mateya, and other Servian lead-

ers to prevent an uprising among the Serbs, Protá Mateya became one of the leaders of the resulting insurrection in 1804. In the following year Kara George sent him to St. Petersburg (now Petrograd) on a special mission, and thereafter he represented Servia diplomatically in Russia, Austria, Rumania, and Turkey. He defended his country's interests at the Congress of Vienna in 1814-15. His memoirs, *Memoari Prote Mateye Nenadovicha* (Belgrade, 1893), are a valuable source for the history of the Servian insurrections against the Turks.

NENANA (nā-nā'nā) **VALLEY**. A valley in the watershed of the Nenana River, a southwestern affluent of the Tanana River, Alaska, its principal fork—Jack River—rising in Broad Pass, about 2500 feet in height. The Nenana, formerly called the Cantwell, is a rapid stream which flows for miles through cañons walled in by cliffs several hundred feet high. Forage plants are good and abundant, game fairly plentiful, and considerable areas of spruce are found. The valley has become of special interest, owing to its forming part of the route of the government railroad, designated by President Wilson in April, 1915, between Seward, Kenai Peninsula (q.v.), and Fairbanks, via Broad Pass and Susitna valley (q.v.). Nenana valley possesses resources of great economic importance in its coal—lignite of somewhat inferior quality. The coal-bearing strata, stretching from the upper Nenana to the Delta River, exceeds 600 square miles in area, the largest field of interior Alaska. From outcroppings it is known that at least 66 square miles are underlaid by coal, with veins of considerable thickness. The rapid devastation, for mining purposes, of the forestal sections of the Tanana valley make it certain that the Nenana coal will become an important element in the industrial development of adjacent regions. Tentative plans have been advanced for the generation locally of electric power for transmission to Fairbanks, 75 miles distant. Gold placers have been discovered, but their exploitation has progressed slowly, owing to scarcity of water and cost of transportation.

NENA SAHIB, nā'nā sū'hēb. Leader in the Sepoy Mutiny in India. See NANA SAHIB.

NENCIONI, nān-chō'nē, ENRICO (1836-96). An Italian poet and critic, born at Florence. He was one of that literary company called the *amici pedanti*, of which Carducci was the leader. He wrote for the *Italia Nuova* and translated much French and English poetry into his language. Especially remarkable are his papers on English literature. Towards the end of his life he held a professorship at the Woman's Normal School in Florence. His works include: *Versi* (1880); *Medaglioni* (1883, 1897); *Studi di letteratura straniera* (1897-98). Consult Croce, "E Nencioni," in *La Critica* (Bari, January, 1906).

NENCKI, nēn'ka, MARCEL VON (1847-1901). A Russian physician, born in Boczki in the Government of Kalish. He studied philosophy at Cracow, Jena, and Berlin and medicine at Berlin (M.D., 1870). In 1872 he joined the medical faculty at the University of Bern, becoming professor of physiological chemistry, and from 1891 was chief of the bacteriological institute in St. Petersburg. He introduced into medicine the use of salol (1886). Among his writings are *Zur Kenntniss der Skatolbildung* (1880); *Beiträge zur Biologie der Spaltpilze* (1880);

and the following contributions to medical journals, later reprinted—"Ueber die Zersetzung der Gelatine und des Eiweisses bei der Fäulniss mit Pankreas" (1876); "Untersuchungen über den Blutfarbstoff" (1885); "Ueber die chemische Zusammensetzung des russischen Nadelholzteers, etc." (1894), with N. Sieber; "Ueber die Rinderpest" (1897).

NENEBOJO. See MANABOZHÖ.

NEN'NIUS. An historian who lived in Wales at the end of the eighth and the beginning of the ninth century and who is believed by some to be the author of the *Historia Britonum*. Little is definitely known about him. The *Historia Britonum* contains a description of Britain and deals briefly with the period of the Roman occupation and the subsequent events, as the incursions of the Picts and Scots and the Saxon conquest. As an historical source it has little value, but it is of some importance for the study of early British mythology, especially for the study of the legend of Arthur and because it contains the genealogies of English kings to 796. The best edition is by Mommsen, in *Monumenta Germaniæ Historica. Auctores Antiquissimi*, vol. xiii (Berlin, 1898). For secondary works, consult Heinrich Zimmer, *Nennius Vindictus* (Berlin, 1893), and Charles Gross, *Sources and Literature of English History* (New York, 1900).

NEO-CELTIC MOVEMENT. This phrase is loosely used to describe generically a variety of recent literary and scholarly activities—in Ireland, Scotland, Wales, Brittany, and elsewhere—concerned with the Celtic past or regarded as expressions of the Celtic spirit. It is also specifically applied, as, e.g., to the Celtic movement in late nineteenth-century Ireland, otherwise known as the Irish Literary Revival, which included scholars in and translators of Gaelic literature as well as Anglo-Celtic poets, dramatists, and story-tellers in whose brains and imaginations something of the distinctive old Celtic spirit seemed born again. It was sometimes used as a label, too, for the attempt at the revival of Irish as a spoken tongue organized as the Gaelic League and in full swing towards the end of the nineteenth century. Various applications of the phrase here in question are exemplified in William Sharp's introduction to *Lyra Celtica* (edited by Elizabeth A. Sharp, Edinburgh, 1896), and from the same anthology, with the introduction to it, some idea of the *personnel* of the Neo-Celtic Renaissance as a whole may be obtained. Conspicuous among those associated with the Neo-Celtic movement as it expresses itself in English are the Irish poet William Butler Yeats, the Irish dramatist J. M. Synge, the Scottish poet Fiona McLeod (William Sharp), and such translators or scholars as Kuno Meyer, Whitley Stokes, Alfred Nutt, Douglas Hyde, and Lady Gregory. See IRISH LITERATURE, *Irish Literature in English*.

NEOCENE (from Gk. *néos*, *neos*, new + *καίρος*, *kairós*, recent). A geologic term employed by the United States Geological Survey to designate the middle portion of American Cenozoic time and corresponding to the combined Miocene and Pliocene periods of the Lyellian classification. The latter is most generally followed at present, even in the United States. See TERTIARY SYSTEM.

NEO-DARWINISM. Although Darwin, in his *Animals and Plants under Domestication*,

gave more weight to changes in the conditions of life, conceding that natural selection was not an exclusive factor in organic evolution, Wallace and others, notably Weismann, have insisted on the all-sufficiency of natural selection, pushing, as many think, Darwinism far beyond its legitimate bounds. See WEISMANNISM.

NEODESHA, né'-dē-sha'. A city in Wilson Co., Kans., 13 miles by rail northwest of Independence, at the confluence of the Verdigris and Fall rivers and on the St. Louis and San Francisco and the Missouri Pacific railroads (Map: Kansas, G 8). The chief industrial plants are a zinc smelter, oil refinery, and brickworks. Neodesha has adopted the commission form of government. It owns its water works, sewage system, and electric-light plant. Pop., 1900, 1172, 1910, 2872.

NEODYMIUM, né'-dīm'-ūm. A metallic chemical element isolated by Auer von Welsbach, in 1885, from a mixture of neodymium and praseodymium that had been regarded as an element and called *didymium*. Neodymium occurs in a number of rare minerals, including cerite, monazite, and orthite. It is separated from the concomitant elements either by fractional precipitation or by fractional crystallization of the nitrates. Neodymium (symbol, Nd; atomic weight, 144.3) is a pale-yellow metal that melts at 840° C. (1544° F.); it may be obtained by the electrolysis of fused neodymium chloride. Among the compounds of neodymium may be mentioned the *oxide*, Nd₂O₃, which may be obtained by heating the nitrate or the oxalate; the *chloride*, NdCl₃, which may be obtained in the form of pink crystals by the action of hydrochloric acid gas upon neodymium hydroxide, and the *nitrate*, Nd(NO₃)₃·6H₂O, which forms double salts with the nitrates of magnesium, rubidium, and ammonium.

NE'OGÆ'A (Neo-lat., from Gk. *néos*, *neos*, new + *γαῖα*, *gaia*, earth). An alternative name in zoogeography for the continent of South America, or Neotropical region, in conformity with Arctogæa, Notogæa, and so on.

NEO-HEGELIANISM, né'-hā-gā'-li-an-iz'm. A term often applied by opponents to the doctrine of those English, Scottish, and American thinkers who, more or less under the influence of Hegel, hold that consciousness and object are mutually implicated, and who, believing in the historical priority of the physical universe to the finite consciousnesses which are in some way correlated with physiological organisms, feel themselves forced to the conclusion that there is an eternal consciousness, of which the universe is the object. T. H. Green, J. and E. Caird, J. Watson, H. Jones, D. G. Ritchie, and Josiah Royce may be mentioned as prominent among those to whom the epithet is often applied. See especially GREEN, THOMAS HILL; ROYCE, JOSIAH. Consult Seth Pringle-Pattison, *Hegelianism and Personality* (Edinburgh, 1893), and the histories of philosophy by Falckenberg, Höffding, Thilly, Ueberweg-Heinze, and Windelband. See HEGEL.

NEO-KANTIANISM, né'-kān'-ti-an-iz'm. A term applied to the doctrine of those followers of Kant who accept the general result of Kant's philosophy so far as the theory of knowledge goes, but do not follow Kant in his endeavor by practical reason to work out a metaphysics. F. A. Lange, H. Cohen, P. Natorp, J. Volkelt, and O. Liebmann may be mentioned as representatives of this tendency. Consult the his-

tories of philosophy by Höffding, Thilly, Ueberweg-Heinze, and Windelband. See KANT

NEO-LAMARCKISM. The modified doctrine held by those naturalists who accept in the main the teachings of Lamarck (q.v.) Lamarck was the first truly scientific thinker to state in a detailed way the causes not only of the origin of species, but of certain types of animal life, such as some orders of birds, of the groups represented by the ai, lemur, the kangaroo, and so on. The chief Lamarckian factors of organic evolution (see LAMARCKISM) are changes in the environment, direct in plants and the lowest animals, indirect in the higher animals; also, the use and disuse of organs, and the transmission of characters acquired during the lifetime of the individual, or what is called use inheritance. The first writer after Lamarck, on the lines laid out by the great French zoologist, was Herbert Spencer. In 1866-71, in his *Principles of Biology*, Haeckel claimed (1868) that we should have to adopt Lamarck's theory of descent for the explanation of biological phenomena, "even if we did not possess Darwin's theory of selection," adding: "The one is so completely and directly proved by the other, and established by mechanical causes, that there remains nothing to be desired."

In America, Cope (1866-71) and Hyatt (1866-74) independently advocated Lamarckian views. Cope first (1871) furnished what he considered as "an actual demonstration of the reality of the Lamarckian factor of use, or motion, as friction, impact, and strain, as an efficient cause of evolution." A. S. Packard (1871), by his studies of the embryology of *Limulus* and of cave animals, was led to adopt Lamarckian views in preference to the theory of natural selection, which never seemed to him adequate or sufficiently comprehensive to explain the origin of variations and the rise of new types; and it was he who originated the term *Neo-Lamarckism*. "Neo-Lamarckism," he explained, "gathers up and makes use of the factors both of the Saint-Hilaire and Lamarckian schools, as containing the more fundamental causes of variation, and adds those of geographical isolation or segregation (Wagner and Gulick), the effects of gravity, the effects of currents of air and of water, of fixed or sedentary as opposed to active modes of life, the results of strains and impacts (Ryder, Cope, and Osborn), the principle of change of function as inducing the formation of new structures (Dohrn), the effects of parasitism, commensalism, and of symbiosis—in short, the biological environment; together with geological extinction, natural and sexual selection, and hybridity."

Among American zoologists who have advocated Lamarckian views are W. H. Dall, J. A. Allen, R. T. Jackson, C. H. Eigenmann, and others, in England, Spencer, Henslow, Cunningham, Gadow, and others; in France, Giard, Perrier, and in Germany and Holland, Haeckel, Wagner, Eimer, Standfuss, Fischer, Plate, Pfeffer, O. Hertwig, Emery, Roux, and others. Consult A. S. Lamarck, *Zoological Philosophy*, translated and with an introduction by Hugh Eaton (New York, 1914).

NEOLITHIC MAN (from Gk. *neos*, *neos*, new + *lithos*, *lithos*, stone). The term applied by European archaeologists to the races in the period when the polishing of stone, agriculture, pottery, weaving, domestication of animals, and

the construction of pile dwellings on lakesides in Switzerland, France, Italy, and Ireland, the burying of the dead in dolmens, and the rearing of megalithic monuments, were practiced. See NEOLITHIC PERIOD.

NEOLITHIC PERIOD. The first step towards placing prehistoric archaeology on a scientific basis was taken in Scandinavia. Thomsen, of Copenhagen, was the first archaeologist to employ the methods of geology and paleontology. Seconded by Forchhammer, Worsaae, Steenstrup, and Nilsson, he succeeded in establishing a relative chronology for prehistoric times. His system, based on the development of human industry, was published in 1836 and has served as a foundation for all later classification. Thomsen divided prehistoric times into the ages of Stone, Bronze, and Iron. His system, applied to the collections of the Copenhagen Museum, was immediately accepted throughout Scandinavia and later by the entire civilized world. In time the three ages were subdivided into periods and epochs. The discoveries in valley deposits and caves of industrial remains older than any known in Denmark led to a subdivision of the Stone age. That portion of the Stone age corresponding roughly in time to the geologic past or Pleistocene was called the *paleolithic* period (q.v.), and that portion dating from the geologic present was called the *neolithic* period. These terms were first employed by Sir John Lubbock. They are preferable to the terms "age of chipped stone" and "age of polished stone." Many of the stone implements belonging to the neolithic period were never polished. On the other hand, although the polishing of stone was never resorted to as a shaping process during the paleolithic period, stones polished by use, such as grinding and polishing stones, do occur.

The dividing line between neolithic and paleolithic was quite naturally placed where the break seemed greatest. In any succession of cultures certain elements are carried to the succeeding phase, while certain elements are lost. The life of some industrial types is short, while that of others is long. The apparent failure of the neolithic to inherit largely from the paleolithic led for a while to the quite general belief in a hiatus between the two periods of the Stone age, a belief that at first seemed to be supported not only by a cultural gap, but by geologic and faunal changes as well. The ice sheet of the last (Würm) glacial epoch was followed in its retreat to the north by cold-loving animals, such as the mammoth, the woolly rhinoceros, and the reindeer. Cave art, inseparably linked with these forms, likewise disappeared. The stag superseded the reindeer. These changes, however, took place before the close, rather than at the close, of the paleolithic period. The Azilian epoch is, properly speaking, the closing phase of the paleolithic, yet it has tended almost to bridge the gap between the latter and the neolithic period, so that the hiatus is evidently more apparent than real.

An important discovery bearing on the transition was recently made by G. F. L. Sarauw on the island of Zealand, Denmark. The station is in the Maglemose (great peat bog). This was apparently a lake station, and, since there are no remains of piles, the dwellings are supposed to have been on rafts. The cul-

tural remains are suggestive of the Azilian. There are no pottery and no polished flint implements, likewise no domestic animals with the exception of the dog. According to Saraauw (and Brögger agrees with him), the Maglemose culture belongs to about the middle of the *Ancylus** period, when the land, somewhat higher than at present, was covered by pine forests (*Pinus sylvestris*) and the Baltic was a fresh-water lake. The Maglemose, then, is the oldest known culture in Denmark. It is also found in regions of northern Germany and southern Sweden.

A change of land level and climate brought on a new epoch, that of the shell heaps. The southern Baltic area sank, converting the great Baltic lake into a sea once more. The oak tree supplanted the pine. As the temperature rose and the sea became more salt, the oyster and *Littorina littorea* took the place of *Ancylus*. The presence of *Tapes decussatus* in the waters of western Sweden, Denmark, and southern Norway indicates that the climate of that region during the *Littorina* or shell-heap epoch was even milder than at present.

The shells of oyster, *Cardium edule*, *Mytilus edulis*, *Littorina*, and *Tapes* make up the great mass of the shell-heap deposits, which often attain large dimensions. Shellfish thus formed the chief nourishment of the people of that time; for, if not the dwelling sites, the shell heaps were at least the great outdoor restaurants of the masses. Mingled with the shells are fish bones and the broken bones of water birds. Less plentiful are the bones of mammals. The elk, common in the Maglemose epoch, has almost disappeared. The dog is the only domesticated animal. Associated with shells and bones are hearthstones, rude chipped-flint implements, bone and horn tools, and potsherds. Among the flint implements the two most characteristic are the pick and the paring knife. (See KITCHEN MIDDEN.) Before the close of the shell-heap epoch the land began to rise and the movement continued till the early Middle Ages.

Outside of southern Scandinavia shell heaps are comparatively rare in Europe, but a culture supposed to be synchronous is found in western Europe, particularly in northern France. It has received the name Campignian, from the station of Campigny in the commune of Blangy-sur-Bresle (Seine-Inferieure). At Campigny are numerous cabin sites, one of which was carefully excavated by Salmon, D'Ault du Mesnil, and Capitan. It proved to be a pit sunk in the gravel bed. At the bottom of the pit was a black mass of charcoal and ashes, with numerous flint implements; also the bones of *Bos*, the stag, and the horse. An analysis of the charcoal proved the presence of the oak. Above the black hearth deposit was a filling of yellow sandy clay, with nodules of clay and industrial remains similar to those of the layer beneath. These two deposits are of Campignian age. While the scrapers, perforators, and graters are suggestive of the upper paleolithic, the two new and dominant forms are the pick and paring knife, so characteristic of the shell-heap industry. The presence of potsherds and the absence of polished flint implements are notable features of the Campignian culture. In the vegetal earth that formed a surface covering over the pit were found polished and other flint

implements. Practically the same stage of culture is to be found at the great camp of Catenoy, near Clermont (Oise). While the superficial layer contained polished flint implements and remains of the Bronze age and Roman times, the industry found at a depth of 30 centimeters and more was confined to forms that first appeared in the paleolithic, and the pick and paring knife (the two new types), as well as pottery. The same phenomenon is repeated at many village sites of western Europe, Italy, and even as far east as Russia. If, then, the Azilian and Maglemose cultures represent the last term in the paleolithic series, the Campignian and the epoch of the shell heaps represent the initial term of the neolithic series.

Chronologic Subdivisions. Archaeologists of the North took the lead in establishing a definite chronology for prehistoric times, since Thomsen's time they have kept pace with the general progress made, especially in the domain of the neolithic and subsequent periods. Stratigraphy is the potent guide to a chronology of the paleolithic period. In the neolithic, on the contrary, stratigraphy is for the most part lacking. Recourse is thus had to the typologic method, with results that do not always carry universal conviction. There is thus as yet no unified neolithic school of thought and practice. In Denmark Worsaae early recognized two neolithic epochs. His successor, Sophus Müller, has gone further by subdividing the second of Worsaae's epochs. Müller's system comprises (1) epoch of the shell heaps, (2) epoch of the pointed pole and the flat-poled axe, and (3) epoch of the dolmens. (See MEGALITHIC MONUMENTS.) The latter epoch is subdivided into three successive stages that of the (a) simple dolmens, (b) many-chambered (giant) dolmens, and (c) stone cists and individual graves. The pointed-poled and the flat-poled axes of the intermediate epoch are apparently derived from the Campignian pick and paring knife of the shell-heap period. Beginning with the second epoch, one begins to find polished flint implements.

During the closing stage of the third epoch, burials were in cists, the walls and coverings of which are comparatively thin flat stones split for the purpose. They were small and covered by insignificant mounds that were never marked by stone inclosures. A cist contains from 1 to 11 skeletons. Closely related to the stone cists and belonging to the very close of the Stone age are the individual graves. These are even less conspicuous than the cists, and, as their name suggests, never contain more than one skeleton, which rests on a floor of loam or stone, is surrounded by a number of stones, and is simply covered with earth. Such burials are in or under low flat mounds.

The characteristic implement of the third period is the thick-poled axe, which is especially abundant in the small and giant dolmens. A large dolmen will contain 20 or 30 axes and chisels and as many arrowheads. Pottery and objects of bone and horn also abound. The perforated battle axe, pecked and ground into shape, is the usual accompaniment of the stone cists and individual graves. Spearheads and poniards are abundant. They are always of flint and belong to a limited number of well-defined types. The hilt or shaft end varies so that one cannot always distinguish between the spear and the poniard. Those with beautifully chipped handles were without doubt poniards. These

* *Ancylus fluviatilis*, a small mollusk that lived in the Baltic fresh-water lake.

are so numerous that it must have been the custom to carry one always in the belt.

It is worth while to trace the evolution of the poniard during the third epoch. In the oldest type there is practically no differentiation between blade and hilt, both are very thin. The margins curve with perfect regularity from the point to the end of the handle. The chipping is done with admirable regularity, often appearing as oblique parallel grooves. In the second stage of development the hilt becomes more and more differentiated from the blade, and is thicker. These two types are found in the dolmens. In the stone cists one finds the third type. The hilt has become quadrangular in section; its breadth is about the same at all points, and the corners are carefully chipped. With the fourth type, also found in the cist graves, the hilt becomes heavier and widens at the pommel, presenting a rhomboidal cross section.

The foregoing classification is practically the same as that worked out by Montelius of Stockholm and, broadly speaking, applies also to northern Germany. In Switzerland the problem is different, and yet even there both Heerli and Gross make a triple division of the neolithic period, the last witnessing the introduction of objects made of copper and hence marking the transition to the age of metals. The three divisions are based principally on the finds made at three lake dwellings. These in the order of age are. Schafis, near Neuville, Moosseedorf, at Munchenbuchsee, and Vinelz, in the Lake of Biene.

The stone axes of the oldest epoch are small, rude, and made of local material. The pottery is crude and undecorated. Woven fabrics are found. Wild animals were used for food in greater quantities than domestic animals. With the second epoch the lithic culture is influenced by the importation of nephrites. Stone implements are finely polished and often perforated. There is an improvement in the potter's art, many of the vessels being ornamented in a simple but effective manner. Wild and domestic animals were about equally employed for food. The population was in a large measure brachycephalic. The characteristic features of the third epoch are the string ornament in pottery, the increasing presence of domestic animals, and the appearance of copper.

It will thus be seen that, if much still remains to be done in the way of relative chronology, one is safe in assuming that there were three more or less distinct phases of the neolithic period—an initial stage, marked by the complete absence of polished flint implements and the appearance of pottery represented by the kitchen middens and the so-called Campignian culture, a middle stage, marked by the introduction of polished flint tools and weapons; and a closing phase, characterized by the occasional appearance of copper objects.

It would be difficult to apply anything like an exact time scale to the neolithic period. If there was no hiatus, then the neolithic begins where the paleolithic left off, say from 10,000 to 20,000 years ago. A very moderate estimate would place the beginning of the kitchen-midden or Campignian epoch at 8000 B.C. and the middle epoch at 6000 to 2500 B.C. It should be recalled that the neolithic period persisted longer in the north than in the south of Europe and Egypt. The figures mentioned are intended to be valid only for central Europe.

Inhumation was the dominant mode of disposing of the dead, but incineration was also practiced to some extent in certain parts of Germany, France, and Switzerland. Neolithic sepulchres belong to five classes: (1) simple burial in the earth without protective envelope of an enduring nature, (2) burial in natural caverns or shelters, (3) in dolmens, (4) in artificial caves, and (5) in stone cists.

Neolithic Contributions to Civilization. European neolithic culture is the resultant of a gradual regional evolution regulated in a measure by forces from without. An analysis of all the elements is impossible in the present state of our knowledge. This much we know, that there was a swing of the culture pendulum towards more serviceable, if less artistic, lines of activity. Magic finally failed to give to an increasing hunter (paleolithic) population a regular and adequate food supply. Neolithic man solved the problem by the domestication of both animals and plants, thus registering one of man's greatest conquests over nature. The dog was the first animal to be domesticated, after that came the horse, ox, sheep, goat, and pig. Among cereals, wheat was the most common, barley, oats, and rye were also cultivated. Flax was the principal textile plant. It is probable that the grape was also cultivated. Other fruits as well as nuts appreciably augmented the neolithic food supply. Thanks to the habit of living in pile dwellings, such delicate products as woven fabrics, cereals, and fruits have been preserved to our day.

Of prime importance was the potter's art, which appeared at the beginning of the neolithic and which ever since has contributed so much to human comfort and well-being, aside from its purely artistic possibilities. The potter's wheel was unknown and the firing was done in the open. Neolithic pottery is divisible into three great groups based on form and decoration. To the first group the Germans have given the name Schnurkeramik, because the ornamentation consists of string imprints. The geographic distribution of the Schnurkeramik embraces central and eastern Europe. The second or calciform group was at one time combined with the first, but it differs not only in form and ornament but also in respect to geographic distribution. The decoration on calciform vases consists of horizontal zones that cover the whole surface of the vessel instead of being confined to the upper third. This group is found widespread in southwestern Europe (Italy, Sardinia, Sicily, France, Spain, and Portugal), also the British Isles, Holland, Denmark, parts of Germany, and Austria. The third group, or Bandkeramik, is decorated by bands consisting of continuous incised or punctate lines disposed in chevrons, undulations, spirals, and otherwise. It is spread over even a vaster territory than the two preceding groups, since it occurs throughout practically the whole of Europe with the possible exception of the British Isles.

Neolithic constructive ability is seen not only in the megalithic monuments and pile dwellings but also in the numerous fortified camps. A good example is the Camp de Chassey (Saône-et-Loire), on the summit of a narrow rock promontory, whose escarpments not only protect but command in all directions. At each extremity are formidable earthworks, that even yet reach a maximum outside height of 14 meters.

Concerted activity and commerce on a considerable scale are indicated by great workshops suitably located for the fabrication of flint implements. One of the greatest workshops is that at Grand Pressigny (Indre-et-Loire), which extends over a zone 12 kilometers in length. The wide distribution of the Grand Pressigny product through commerce is easily traceable on account of the peculiar beeswax color of the flint. M. de Saint-Venant in a special study has traced the dissemination of these flints over a large area, including Brittany, northern France, western Switzerland, and even into Belgium, where local flint of another variety is by no means rare.

Only in the neolithic period did man first begin to realize that the earth and the fullness thereof was his. He regulated the food supply by domesticating animals and plants. The ceramic and textile arts were made to minister to his comfort. In the matter of tools and weapons his choice of materials was still limited to stone, wood, bone, and horn. Flint was his chief reliance, and this he had learned not only to chip with much dexterity but also to polish. He also observed that dry, weathered-surface flints were more difficult to manipulate than those *in situ*. As a result the mining for flint became an important industry. The mining was done not only by open cast but also by shafts and galleries. At the well-known neolithic flint mines of Spiennes, near Mons, Belgium, discovered in 1866, two methods of mining were employed: galleries were driven in from the valley slope and shafts were sunk from the surface of the plateau above. Here the mining operations occur over an area of 60 acres, some of the shafts being sunk through flint veins of poor quality to a depth of 10 meters before reaching the kind of flint desired. At the bottoms of the shafts are chambers of considerable size from which galleries radiate in various directions. After extracting the flint the galleries were filled with rubble as a precautionary measure. At Obourg, Belgium, the open-cast system was employed. This is thought to antedate mining by shafts and galleries. Some of the trenches at Obourg reached a depth of 4 meters. Here the skeleton of a miner with his tools was recently unearthed. He had evidently been accidentally buried while engaged in driving a crosscut between two trenches.

The mining tools were picks of staghorn and flint. The scapula of *Bos longifrons* was also employed, probably as a shovel. Much workshop debris is found about the shafts of flint mines. The great flint mines of Grimes' Graves and Cissbury in England are well known. Flint-mining operations are traceable all the way from Norfolk to Sicily. With the introduction of metals, the mining of flint for implements gradually fell into disuse. It persists, however, even to-day at Brandon (Suffolk), where the product is converted into gun flints. Since the introduction of the automobile the exploitation of flints for road metal is no longer so popular as it once was. Thus it is that new inventions and the discovery of utilizable elements hitherto unknown have ever been powerful factors in the conservation of natural resources.

Neolithic Races. The principal European races of the present time are: (1) the Northern blond dolichocephalic race; (2) Mediterranean, dark-haired, dark-eyed, dolichocephalic; and (3) Alpine brachycephalic race. Skulls representing

these three types are found in neolithic graves and in approximately the same geographic distribution. Of the dolichocephalic races one has a high forehead and long face, the other a low forehead and a broad face.

Remains of a pygmy race dating from the beginning of the neolithic and even earlier have been encountered in central Europe, especially in Switzerland, parts of Germany, and France. The pygmy skeletons are always associated with those of normal size in the same graves and cemeteries.

The elements that go to make up the neolithic population of Europe are not foreign to those seen in the last paleolithic races. To a certain extent, therefore, somatology is not inconsistent with archaeology. Both seem to point to a gradual diffusion of new blood and new ideas rather than to changes due to invading and conquering hosts. Combined cultural, physical, and linguistic studies may yet succeed in throwing new and much-needed light on the nature and number of the elements that entered into the make-up of the European neolithic population. See BRONZE AGE, EUROPE, PEOPLES OF; MAN, SCIENCE OF, *Ancient Types*.

NE'ON (Gk. *néon*, neut. sing. of *néos*, *neos*, new). A gaseous element obtained from the atmosphere by Ramsay and Travers in 1898. It resembles helium and the other members of its group in being chemically inert, no compound of helium with any other element being known. Neon is separated from the air in the same way as krypton. Neon (symbol, Ne; atomic weight, 20.2) is a colorless and odorless gas which can only be liquefied below -210° C. Its molecules, like those of argon, helium, and the other rare gases of the atmosphere, are made up of single atoms. One million volumes of air have been shown to contain about 15 volumes of neon.

NE'OPHYTE (Fr. *néophyte*, from Lat. *neophytus*, from Gk. *neóphytos*, from *néos*, *neos*, new + *phytós*, *phytos*, grown, from *phéiv*, *phyein*, to grow). The name given in early ecclesiastical language to persons recently converted to Christianity. The word is used in this sense in 1 Tim. iii. 6, and is explained by St. Gregory the Great as an allusion to "their being newly planted in the faith." It differed from catechumen (see CATECHUMENS), in supposing the person to have not only embraced the doctrines of the Church, but also to have received baptism. The passage referred to directs Timothy not to promote a neophyte to the episcopate; and this prohibition was generally maintained, although occasionally disregarded in extraordinary circumstances, such as those of St. Ambrose (q.v.). In the modern Roman Catholic church the same discipline is observed, and extends to persons converted not alone from heathenism, but from

any sect of Christians separated from the communion of Rome. The time, however, is left to be determined by circumstances.

NEO-PLATONISM. The name applied to the teachings, primarily of the Græco-Alexandrian school of philosophy, and later of a number of Italian humanists, as well as some Englishmen. The extension of the Roman Empire and the growing intercourse between different parts of the world gave rise to an eclectic tendency which combined features of various systems. The process of amalgamation showed itself most prominently at Alexandria, whose central position made it a meeting place for the chief religions and philosophies of the ancient world. Such a philosophy, therefore, as that promulgated by the Neo-Platonists, combining the peculiar mental characteristics of the East and the West, naturally originated there, though it soon ceased to have any local connection. The term Neo-Platonism is sometimes loosely used to signify the whole new intellectual movement proceeding from Alexandria, and attempts have been made to include among its exponents some of the Christian Fathers, such as Clement of Alexandria and Origen, but the name is more properly applied to the school of Ammonius Saccas (q.v.) and his followers. Plotinus (q.v.), a pupil of Ammonius, was its most important champion. Porphyrius, Iamblichus, and Proclus (qq.v.) represent a continuous decline in philosophic interest and a greater and greater tendency to wild and fantastic religious syncretism. In common with Neo-Pythagoreanism and the Judæo-Alexandrian philosophy represented by Philo, the teaching of this school is characterized by an opposition of the divine and the earthly, an abstract conception of God which excludes all knowledge of the divine essence, a contempt for the world of sense which rests on the Platonic doctrines of matter and of the descent of souls into bodies, the supposition of mediating forms which carry over the divine operations into the world of phenomena, the demand for an ascetic liberation from a life of sense, and a faith in a higher revelation obtained in ecstasy. The basis of the divine nature for this philosophy is unity, the one, from this as the primordial source of all things emanates pure intelligence, and from this, in turn, emanates the soul of the world, whose creative activity produces other lesser souls, of men and animals. The doctrine of the divine immanence in this *anima mundi* was one of the most marked points in later Neo-Platonism, and led very close to pantheism. One of the last Neo-Platonists of antiquity was Boethius (q.v.), who by his continued popularity became the most influential medium for the transmission, during the early Middle Ages, of Greek philosophy to western Europe.

The fifteenth century witnessed a strong revival of interest in these speculations. Nikolaus of Cusa (see CUSA) and other mystics sought to overcome the doubt arising from the inadequacy of human conceptions by the theory of man's immediate knowledge or intuition of God—a theory distinctly akin to the Neo-Platonic doctrine that the soul in a state of ecstasy has the power to transcend all finite limitations. The Italian humanists, in their reaction against the previously dominant Aristotelianism, paid great devotion to anything that seemed to derive from Plato. Marsilio Ficino, especially, by his translations of Plotinus, Porphyrius, and Iam-

blichus, contributed to the spread of these doctrines. The Cambridge Platonists (q.v.) were not without their affinities to the Alexandrian teaching, and Wordsworth's prevalent idea of the existence of a soul in nature which holds converse with the soul of man might be traced to the same source.

J. Whithy, *The Wisdom of Plotinus: A Metaphysical Study* (London, 1909); F. W. Bussell, *Neoplatonism and Christianity* (New York, 1911); also the histories of philosophy by Thilly, Ueberweg-Heinze, and Windelband. See NEO-PYTHAGOREANISM.

NEOPTOLEMUS (Lat., from Gk. *Νεοπτόλεμος*, *Neoptolemos*). The son of Achilles and Deidamia, also called Pyrrhus. After the death of his father he was taken by Odysseus to Troy, where he was distinguished by his courage, and was one of the band who entered Troy inclosed in the wooden horse. He was the slayer of the aged Priam (Consult Vergil, *Æneid*, ii, 469-558.) He returned with rich spoils to Phthia and married Hermione, the daughter of Menelaus. According to later legend he brought back with him as part of his booty Andromache, the wife of Hector, and settled in Epirus (*Æneid*, ii, 293 ff.), to become there the ancestor of the Molossian kings. Later he married Hermione when he had gone to Phthia to restore Pelus to his throne. He was killed at the altar at Delphi by Orestes, the former lover of Hermione, or by the Delphians. He was buried within the precincts of the temple, where he was afterward worshipped as a hero.

NEO-PYTHAGOREANISM. The name of one of the two Græco-Alexandrian schools of philosophy, the other school being the Neo-Platonic (See NEO-PLATONISM). Pythagoreanism was revived in the first century B.C. by P. Nigidius Figulus, a Roman prætor, but Apollonius of Tyana (q.v.) was the most prominent representative of this attempt to blend Pythagorean philosophy with Oriental theosophy. The Neo-Pythagoreans regarded it as the greatest task of the philosopher to purify himself from connection with matter by the suppression of desire and by the observance of certain ceremonial rules which were adopted from the earlier Pythagorean brotherhood. In their theoretical system, numbers had symbolic significance. Consult Zeller, *Die Philosophie der Griechen*, part iii; *Die nacharistotelische Philosophie* (3d ed., Leipzig, 1880-81); Vacherot, *Histoire critique de l'école d'Alexandrie* (Paris, 1846-51); also the histories of philosophy by Ueberweg-Heinze, Windelband, Erdmann, and Bergmann.

NEO-REALISM. See REALISM.

NEORNITHES, né-ôr'ni-thêz (Neo-Lat. nom. pl., from Gk. *néos*, *neos*, new + *ôrnis*, *ornis*, bird). Modern birds, as distinguished from those of Jurassic times, which are called *Archornithes*. They are characterized by fused metacarpals, the second finger longest, and the caudal vertebrae not more than 13 in number. The group

comprises not only existing groups, but all fossil birds except *Archaeopteryx*.

NEOSALVARSAN. See SALVARSAN.

NEOSHO, nè-ô'shò. A city and the county seat of Newton Co., Mo., 19 miles southeast of Joplin, on the Kansas City Southern, the Missouri and Northern Arkansas, and the St. Louis and San Francisco railroads (Map: Missouri, B5). It has a public-school library. The United States government fish hatchery here includes 34 ponds, well stocked with various species of fish. The city is on the edge of the zinc and lead mining district of southwestern Missouri, has a canning factory and planing mill, and manufactures foundry and machine-shop products, agricultural and mining implements, flour, etc. Settled in 1839, Neosho was incorporated as a town in 1868, and in 1878 was chartered as a city. The water works are owned by the municipality. Pop., 1900, 2725, 1910, 3661.

NEOSHO. A river rising in Morris County, east-central Kansas (Map: Kansas, G 6). It flows east and then southeast, draining eastern and southeastern Kansas, and then southward, emptying into the Arkansas River, just below Fort Gibson, Okla. It is about 400 miles long, and its drainage basin has an area of about 12,600 square miles. The chief towns on its banks are Oswego, Burlington, and Emporia. Its principal tributary is the Spring River.

NEOTROPICAL REGION. In zoogeography, a primary division embracing South America and its islands, Central America, and the hot lowlands of Mexico and the West Indies. Other names proposed for it have been Austro-Columbian, Dendrogea, and Notogaea. Its characteristics are more distinctly marked than those of some of the other regions, and indicate a remote antiquity for the mainland areas and a long period of isolation from North America. It also has some curious resemblances to the Australian region, especially in the presence of marsupials and ratite birds. It is naturally divided into four subregions by physiographic features. The first, or Brazilian, subregion comprises the great forested equatorial area from the Caribbean coast to the pampas of southern Brazil. The second, or Chilean, subregion stretches along the Andean plateaus and the dry coast strip between the Andes and the Pacific, from Peru to about lat. 4° N. The third, or Mexican, subregion (q.v.) consists of Central America and tropical Mexico. The fourth, or Antillean, subregion embraces all the West Indies except Trinidad and Tobago, which are continental in their characteristics. The region as a whole is characterized by great richness of life, as well as by marks of isolation. Wallace found that it had eight families of mammals absolutely confined to it, including the distinct group (Cebidae and Haploidae) of New World monkeys, the bloodsucking bats (Phyllostomidae), the chinchillas, cavies, and three other families of rodents. Nearly all the edentates of the world are collected here—sloths, armadillos, anteaters, and the like. It has also many important lesser groups, as the llamas, the opossums (save two species), the hutias, the solenodons, and many peculiar carnivores. The absence of certain groups is notable; it has no civets, no insectivores (save a shrew or two from the North), no wild cattle or sheep, no ruminants except the llamas and a few deer, and no other hoofed mammals except the tapir (elsewhere known only in Malaya) and the

peccary. In birds the case is even more extraordinary. About 25 of its families are not known elsewhere, including such large or peculiar groups as the plant cutters, manakins, cotinga, ant thrushes, tree creepers (*Dendrocolaptidae*), toucans, todies, motmots, curassows, tinamous, sun bitterns, and many others, while it possesses the great majority of several groups, such as the humming birds, only scantily present in North America, and not known at all in the Old World. A similar account might be given of regional peculiarities in the departments of reptiles, amphibians, fishes, and the many branches of invertebrate life. The West Indies, as a part of this region, present some extraordinary peculiarities. Though so near to the shores of North America, their zoological affinities are distinctly Neotropical, and they present curious resemblances to the island fauna of Madagascar. See AMERICA, *Fauna*; Zoogeographical Map under DISTRIBUTION OF ANIMALS, and consult the authorities there cited.

NE'ZOIC (from Gk. *neos*, new + *ζωή*, *zōē*, life) A term introduced by Edward Forbes to include all the strata from the Trias to the most recent deposits. It has been occasionally used as a substitute for Cenozoic (see CENOZOIC ERA) and for the Tertiary system (q.v.).

NEPAL, nè-pāl', or **NIPAL**. An independent state on the south slope of the Himalaya, bordering on British India (Map India, E 3). It is bounded by Tibet on the north, by the native State of Sikkim and Bengal on the east, and by Behar and the United Provinces of Agra and Oudh on the south and west. Its area is estimated at 54,000 square miles.

The southern portion, known as the terai, is a level strip of land, partly covered with forests and well cultivated. The rest of the country belongs to the region of the Himalaya (q.v.) and contains some of the highest mountains in the world, such as Mount Everest (29,002 feet), Kinchinjunga (28,156 feet), and Dhaulagiri (26,826 feet), which are covered with perpetual snow. There are a number of minor ranges intersecting each other and inclosing numerous valleys. The country belongs to the basin of the Ganges, its chief rivers being the Karnali and the Sarda in the west, the Gandak in the centre, and the Kosi in the east. The rain which occurs under the onblowing monsoons, June to October, is not heavy. The temperature varies considerably in accordance with the configuration of the surface. In the mountainous part it is naturally cold, while in the flat region along the south boundary and in some of the valleys of the interior it is hot and humid between April and June. The average temperature at Katmandu (over 4300 feet) is about 62° F. Deposits of iron, lignite, copper, lead, and zinc are found and exploited to some extent by the natives. There are also many mineral springs and some deposits of gold and silver. The chief occupation of the inhabitants is agriculture and grazing; the former, carried on in a primitive way, is highly intensive, owing to the scarcity of agricultural land. The slopes of the hills and ledges even, difficult of access, are utilized for agricultural purposes, and the methods employed for diverting mountain torrents for irrigational needs exhibit noticeable and varying degrees of ingenuity. See NAIPIALI LANGUAGE.

The chief crops in the central valleys are several varieties of rice, wheat, pulse, corn, sugar

cane, potatoes, and various vegetables. In the teral region are cultivated tea, cotton, tobacco, etc. Many European fruits are successfully cultivated. Famine is unknown, and the people in general are prosperous. The chief manufactures are coarse cotton cloth, paper, brass bells, utensils, and ornaments. Excellent pottery is produced in some parts of the country, and the wonderful wood carving found in the temples testifies to the skill of the natives. Wood carving, however, as well as artistic working in brass, has declined. The commerce of Nepal is chiefly with British India and Tibet. From British India are imported cotton piece goods, cotton yarn, woolen goods, silver, spices, salt, brass, copper, sugar, iron, leather goods, etc. These are partly reexported to Tibet, which sends in return drugs, shawl wool, coarse woolen cloth, salt, paper plant, domestic animals, honey, wax, quicksilver, gold, etc. The chief exports to British India are rice, oil seeds, cattle, tobacco, hides, timber, spices, and ghee. The exports to and imports from British India amounted in 1912-13 to Rs 45,498,493 and Rs 22,243,544 respectively. Goods are usually transported by human carriers or pack animals.

Nepal is a monarchy. The actual ruler is the Prime Minister, who is nominally assisted by a council of his own choosing. There are civil and criminal courts. The savage native code has been humanized by British influence. Foreign relations are controlled by the government of India, which is represented at Katmandu, the capital, by a Resident. The revenue of the government is derived chiefly from land tax, customs, mines, forests, and monopolies. There is an efficient army of about 45,000, including 2500 artillery, which can be greatly enlarged in case of necessity in view of the fact that the Gurkhas (q.v.) are able fighters.

No reliable figures as to the population of Nepal are available. Native statistics place it at 5,000,000, but these figures are probably exaggerated by at least a million. The great mass of the population of Nepal are by some considered to be Mongolic with large infusions of Dravidian and Aryan blood, while others regard them as a mixed race of Indo-Afghan and Mongolic descent. The Gurkhas (q.v.), the ruling class, are the typical representatives of the Nepalese; they include the military tribes of the Khas, Gurungs, Magars, and Thakurs and are descended from aboriginals who intermarried with Rajput and other Hindu refugees from the Mohammedan invasion of the twelfth century. The Gurkhas are spread throughout the country. The Newars, who inhabit the valley of Nepal, constitute the largest division of the population. The Bhotias, who dwell in the east, include several tribes of Tibetan stock—the Kirantis, the Murmis, and the Limbus. Other tribes are the Lepchas, the Tharus, and the Bokras. The languages spoken in Nepal belong to the Tibeto-Himalayan branch of the Tibeto-Burman family of the Indo-Chinese languages. The lingua franca is Parbatya, i.e., hill speech, which resembles Hindi and is written in the Nagari character. The religion of the ruling dynasty and of the majority of the Gurkhas, Tharus, and Bokras, and of a part of the Newars, is Hinduism; the other inhabitants profess Buddhism and are accorded complete religious liberty. The two religions are supposed to be about equal numerically. Education is entirely in the hands of the priests,

and the bulk of the population are illiterate. The children of the wealthy classes are sent to the educational establishments of British India.

History. Various ruling dynasties from a remote period are given in the native literature, but the first authentic mention of a ruler—Anquvarma of the Thakuri dynasty—is made by Hiuen Tsang, the Chinese Buddhist pilgrim, who visited Nepal in the seventh century. In 1324 the country was invaded and occupied by Harisinha-deva, Rajah of Simraungarh. Modern history begins in 1768 with its conquest by the Gurkhas, who originally were driven from Rajputana by the Mohammedan invasion. Gurkha aggressions on Tibetan territory in 1790 led to their defeat by China and the limitation of their northern boundary. In 1814, by way of reprisals, the British invaded the country, but were defeated, the following year, however, advancing on Katmandu, they obtained favorable conditions of peace and the establishment of a British Residency at the capital. By the assassination of his uncle in 1845 and by the Kot massacre of his opponents in the following year, Jung Bahadur, a colonel in the army, became Prime Minister and nominal ruler. Having firmly established himself in power, he visited England in 1850, and after his return the fruits of his journey were exhibited in the wise reforms that he introduced. During the Indian Mutiny of 1857 he rendered valuable assistance to the British and was handsomely rewarded. He died in 1877 and was succeeded by his brother, who also resorted to wholesale executions to maintain his ascendancy and ruled until 1885, when he was murdered at the instigation of Bir Shamsheer Jang. The latter became Prime Minister and father-in-law, by two daughters, of the reigning Maharajah, Prithivi Bir Bikram, who was born in 1875 and ascended the throne in 1881. The Maharajah died in 1911 and was succeeded by his son, Tribhubana Bir Bikram. In 1901 Sir Chandra Shamsheer Jang succeeded Bir Shamsheer Jang as Prime Minister.

NEPALI LANGUAGE. See NAIPALI LANGUAGE.

NEPAUL. See NEPAL.

NEPEN'SIS COLO'NIA. See NEPI.

NEPENTHE, nê-pên'thê, or **NEPENTHES**, nê-pên'thêz (Gk. *νηπενθής*, *nêpenthês*, from *νη*, *nê*, negative prefix + *πένθος*, *penthos*, grief). In the *Odyssey*, iv, 221, an epithet of a drug given

to Helen in Egypt, possessing the power to bring forgetfulness of every pain or grief. Later writers identified the drug with opium or some preparation of hemp

NEPENTHES. A genus of herbs or half-shrubby plants of the family Nepenthaceæ. The species are natives of swampy ground in India, Indo-China, Malaysia, Madagascar, etc., and are chiefly remarkable for the leaves of

A CULTIVATED VARIETY OF NEPENTHES.

solved by a ferment secreted by the leaves and absorbed, so that the nepenthes rank among insectivorous plants. Many of the species are epiphytes, being attached to trees and other plants, and are rather commonly grown in hot-houses for their strange leaves. The name "pitcher plant" is applied to many other plants, as *Sarracenia* spp., *Arisæma triphyllum*, etc.

NEPH'ELITE (from Gk. νεφέλη, *nephelê*, cloud). A mineral sodium-aluminium silicate that crystallizes in the hexagonal system, has a vitreous or greasy lustre, and is generally colorless or light yellow, though sometimes when found massive it is green or red. It occurs in both ancient and modern volcanic rocks and in crystalline rocks, such as syenite. It is found in the lavas of the volcanoes of Italy, also in Bohemia, France, Brazil, and Canada; in the United States the massive and crystallized varieties are found in Maine, New Jersey, the Ozark Mountains (Arkansas), and Montana.

NEPHELITE, or **NEPHELENE**, **SY'E-NITE**, *Laurvigite*. An igneous rock of granitic texture, of which the essential mineral constituents are nephelene and alkali feldspar. Nephelene syenites usually contain also an alkaline variety of pyroxene (acmite or ægirine) and frequently also nosean or hauyne, sodalite, sphene, and peculiar varieties of mica (lepidomelane) and garnet (melanite). These minerals are so generally found together, and so rarely occur except when in association with nephelene or the allied mineral leucite, that the nephelene syenites and a few rare families of rocks (leucite syenites, theralites) are quite marked in their peculiarities. Nephelene syenites are very rich in the alkalies and alumina. They are quite subject to alteration by weathering processes. They occur in rather small bodies as a rule and are not so common as the ordinary class of syenites. (See **SYENITE**.) There are outcrops at Litchfield, Me.; Salem, Mass.; Beemerville, N. J.; Magnet Cove, Ark.; and in other places in the United States and in Canada.

NEPHELIUM. A genus of plants. See **LITCHI**.

NEPHI, né'fi. A city and the county seat of

Juab Co., Utah, 87 miles south of Salt Lake City, on the San Pedro, Los Angeles, and Salt Lake and the San Pete Valley railroads (Map: Utah, C 3). It is the distributing point for a district interested chiefly in farming, lumbering, and cattle raising and in the mining of salt and gypsum. The water works and electric-light plant are owned and operated by the city. Pop., 1900, 2208. 1910, 2759.

NEPH'OSCOPE (from Gk. νέφος, *nephos*, cloud + σκοπεῖν, *skopein*, to view). An instrument used by meteorologists for observing the clouds, and especially for determining the amount and direction of the horizontal component of the apparent motion of a cloud. The modern nephoscope is the development of an idea embodied by Aimé in 1846 in his so-called reflecting anemometer, and in its best form it has a wide range of usefulness. The simplest form is merely a horizontal mirror having a circular graduated edge. The observer brings one eye to such a position that the reflected image of the cloud is seen to pass from the centre of the mirror to the circumference, and he merely records the direction in which the image appears to pass off. The Marvin nephoscope, an instrument of high precision, is used by the United States Weather Bureau observers, and has been extensively employed in cloud observations. A form of nephoscope for use on vessels at sea was devised by Professor Finemann and used by him about 1888. About the same time Professor Abbe devised his marine nephoscope and a method of using it for determining absolute altitudes and movements of clouds at sea. It consists essentially of a light bronze circle fitting rather loosely on top of the ordinary ship's compass, it therefore replaces the nearly horizontal circle of the apparatus ordinarily used by the navigator to sight upon the sun when measuring azimuths. The bronze circle is graduated, and at its zero point carries a hinge and an adjustable arm having at its end a knob which serves to define the line of sight. The circle also carries a glass mirror from which the quicksilver backing has been removed, leaving a transparent circle, through which the graduation of the compass needle can be read. As this marine nephoscope enables one to locate a storm centre by the motions of the lower clouds better than can be done by the wind, and as it gives the direction of the pennant at masthead much more accurately than it can be observed by the unaided eye, it is strongly recommended for use by navigators at sea. To ordinary meteorological observers it has the special advantage of being the only instrument by means of which observers at sea can easily determine the absolute altitude and movements of clouds.

In 1897 Louis Besson of Paris devised the nephoscope now generally known by his name, also sometimes called a cloud rake from its general resemblance to that garden implement. Besson's device consists essentially of a horizontal rod provided with seven short upright points or teeth, three on each side of, and evenly spaced from, the middle tooth, which is in the axis of a vertical staff rigidly attached to the horizontal rod at its middle.

To observe cloud direction and velocity with this nephoscope (it is of course not a portable device), the observer takes position so that a selected cloud point falls immediately behind the central or axial tooth of the rake. Remaining in this position, he then turns the rake until

the line of teeth is in perspective agreement with the path of the moving cloud point observed. When thus adjusted, the direction of the assumed horizontal cloud path may be read off directly by the appropriate indicator on a graduated disk. The velocity of the cloud is determined by observing the time interval elapsing between the moment when it was on the middle tooth and the time at which it reached any other given tooth. Appropriate formulas, examples, and certain interesting problems which the use of this nephroscope developed will be found in the *Meteorologische Zeitschrift*, September, 1903, pp. 404 ff.

Bibliography. A full account of various forms of nephoscopes is given in Cleveland Abbe, *Treatise on Meteorological Apparatus and Methods* (Washington, 1888), published as part ii of the *Annual Report, Chief Signal Officer* for 1887. The Marvin nephroscope is described in the *Monthly Weather Review*, vol. xxiv (Washington, 1896), and also in separate pamphlets. The description of Abbe's marine nephroscope was first published in 1893 in the *Report of the International Meteorological Congress* held in Chicago (*Weather Bureau Bulletin* No. 2). A general description of work done with it is contained in the *American Meteorological Journal* for October, 1891.

NEPHRECTOMY (from Gk. νεφρός, *nephros*, kidney + ἐκτομή, *ektomē*, excision, from ἐκ, *ek* + τομή, *tomē*, a cutting, from τέμνειν, *temnein*, to cut). The total removal of a kidney in rare cases of acute or chronic infection, either because the kidney is useless or because it is a source of infection owing to abscesses in its substance. Other conditions demanding removal are congenital malformation, hydronephrosis (destruction of the kidney from blocking of the ureter), and tumors. A kidney may be approached through an abdominal incision, but an oblique extraperitoneal lumbar incision is the route generally preferred. Cutting through the lumbar muscles obliquely, beginning an inch below the twelfth rib, making his incision downward and forward, the surgeon reaches the kidney. Blunt dissection frees it from its site and divests it of its capsule. Its pedicle is then tied, and it is separated and removed. Shock, severe hemorrhage, suppression of urine, peritonitis, or injury of neighboring structures may be unavoidable and add considerably to the risk of the operation. Consult Kelly and Burnham, *Diseases of the Kidneys, Ureters, and Bladder* (New York, 1914).

NEPHRITE (from Gk. νεφρός, *nephros*, kidney). A variety of amphibole that varies from white to dark green in color, according to the amount of ferrous oxide that it contains. It is known chiefly through the carved ornaments and utensils that are found among the remains of primitive man in various parts of the world, especially in China and Mexico, and known under the collective name of *jade* (q.v.). Many imaginary virtues were ascribed to it, and it was especially sought after as a cure for epilepsy and diseases of the kidneys.

NEPHRITIS. See BRIGHT'S DISEASE; CIRRHOSIS.

NEPHROTOMY (from Gk. νεφρός, *nephros*, kidney + τομή, *tomē*, a cutting). The operation of cutting open a kidney for the purpose of removing a stone (nephrolithotomy) or evacuating pus. An incision is made in the lumbar region, obliquely, from the outer border of the

sacro-lumbalis muscle, an inch below the twelfth rib, parallel to the rib and forward and downward. The organ being grasped and drawn into the wound, the surgeon bisects it through its convex edge, removes the calculi, or evacuates the pus. The viscus is sutured and replaced when uninfected, as after the removal of a stone; when an abscess is present, the cavity must be drained. Consult Warren-Gould, *International Text-Book of Surgery* (Philadelphia and London, 1902).

NEPHTHYS (Lat., from Gk. Νέφθυσ, *Nephtus*, Egypt. *Nebt-hat*). An Egyptian goddess, the daughter of Seb and Nût, and the sister and wife of Set (q.v.). By her brother Osiris, or Set, she was the mother of Anubis (q.v.). Though in the earliest period she was regarded as a female counterpart of Set and always associated with him, still in the legend she joins with her sister Isis, in mourning over and guarding the body of Osiris, and therefore in funerary scenes the two goddesses are often depicted protecting the mummy of the deceased. The lamentations of Isis and Nephtys over the body of Osiris form the subject of a poem of which several copies have been preserved. Nephtys is usually represented as a woman wearing upon her head the ideogram of her name. As a protector of the dead from evil influences she was worshipped throughout Egypt. Consult Horrack, *Lamentations d'Isis et de Nephtys* (Paris, 1866). Alfred Wiedemann, *Religion of the Ancient Egyptians* (Eng. trans., New York, 1897), E. A. T. Wallis Budge, *The Gods of the Egyptians*, vol. II (London, 1904).

NEPI, nă'pē. An episcopal city in the Province of Rome, Italy, 17 miles southeast of Viterbo. It is the Etruscan Nepete and the Roman Colonia Nepensis. The town is encircled by its ancient walls and towers and has a Roman aqueduct, an eleventh-century cathedral, a ruined castle, built for Pope Alexander VI and used as the residence of Lucretia Borgua in 1500, also a handsome Renaissance municipal palace. Pop., 1901, 3036, 1911, 3063.

NEPISSING, LAKE A lake of Canada. See NIPISSING, LAKE.

NEPOMUK, nă'pō-muk, JOHN OF. See JOHN NEPOMUK SALVATOR.

NEPOS, CORNELIUS. A Roman historian. The place and precise time of his birth are unknown. He was the friend of Cicero and Catullus. The only work of his which has survived is a series of 25 biographies, generally brief, of warriors and statesmen, mostly Greeks; this series is part of a work in 16 books, *De Viris Illustribus*. These biographies are distinguished by the simplicity and purity of their Latinity, the conciseness of their style, and their admirable delineation of character; but sufficient care has not been exercised in the examination of authorities, nor is the relative importance of things duly regarded. But in many matters they supplement, in important ways, other sources of information. Until the middle of the sixteenth century these biographies, on the strength of the titles given in the various manuscripts, were generally ascribed to Æmilius Probus, a writer who lived in the latter part of the fourth century, but in 1569 an edition was put out by the famous Dionysius Lambinus, who pronounced the so-called *Lives* of Æmilius Probus to be in reality the lost work of Cornelius

Nepos, De Viris Illustribus. This view is now generally accepted. The mistaken ascription to Probus arose from the presence in the manuscripts, after the "Vita Hannibalis," of a dedicatory epigram, by Probus, to Theodosius. There are many editions, among which may be mentioned those of Van Staveren (Leyden, 1773), of Tzschucke (Göttingen, 1804), of Fleckeisen (Leipzig, 1884), of Nipperdey (10th ed., ib., 1896), of Rolfe (Boston, 1894), of Lindsay (New York, 1895), of Flagg (ib., 1895), and of Winstedt (text, Oxford, 1904). Nepos wrote also *Chronica*, an epitome of the world's history, *Exempla*, a series of anecdotes; and letters. Consult Martin Schanz, *Geschichte der römischen Literatur*, vol. 1, part ii (3d ed., Munich, 1909).

NEPOS, JULIUS. A Roman emperor (474-475). He succeeded his uncle Marcellinus as Prince of Dalmatia. After the death of Olybrius, Nepos was selected by Leo I, Emperor of the East, his kinsman by marriage, to occupy the Western throne. As Emperor he ceded to the Visigoths the Province of Auvergne. In 475 Orestes, father of Augustulus, marched against Nepos at Ravenna. Nepos fled to Salona, where he was assassinated in 480 by two of his own officers. Consult *The Cambridge Medieval History*, vol. i (New York, 1911).

NEPTUNE (Lat. *Neptunus*), or **POSEIDON** (Gk. Ποσειδών, *Poseidōn*, Δοις Ποσειδάων, *Poteidaōn*, Ποσειδάων *Poteidaōn*, of uncertain etymology. Many connect the Greek name with Gk. πόντος, *pontos*, the open sea, and ποταμός, *potamos*, a river). In classical mythology, a brother of Zeus and lord of the sea. In legend he is the son of Cronus and Rhea. His home is a splendid palace in the depths of the sea near Ægæ, though which town of this name was meant caused much dispute. His wife in Hesiod is Amphitrite, and she shared his cult on the isthmus. As a lover he rivals his brother Zeus, and many legends traced local heroes to Poseidon and some nymph or daughter of an early king. So Neleus and Pelias were sons of Poseidon and Tyro. In his nature Poseidon is always wild and implacable, never becoming a guardian of higher virtues. He is the shaker of the earth, a natural conclusion from the frequency with which disturbances of the sea accompany the shocks on land, but he is, above all, the master of the sea, who sends the dreaded storms and at his will controls the waves, which are called his swift horses. His attribute is the trident, or three-pronged harpoon of the Ægean fisherman, with which he controls the waves or brings springs from rocks. Closely associated with him is the horse. He was the horse tamer and was honored with horse races at many points, horses were frequently sacrificed to him, and there are traces of a belief that he was in the form of a horse. His worship was chiefly confined to the coast, though he had temples even in the inland country of Arcadia, and it is not at all improbable that he was originally a god of water and moisture in general. There is some evidence for a decline in Poseidon worship, which seems reflected in the legends of his contest with Athena for Attica and with Hera for Argos. At Athens he was worshiped in the Erechtheum, and some have held that Erechtheus was in essence identical with Poseidon, or a form of Poseidon, and that this deity Poseidon-Erechtheus, overpowered by Athena, was converted into an agricultural deity. From him was also named the Attic month Poseideon

(about December). He was a great Ionian divinity, and the Panionia were celebrated by the 12 Ionic cities at his sanctuary at Mycale. His temple on the island of Calauria, where Demosthenes died, was in very early times the centre of an amphictyony or league of maritime states. His most famous cult, however, was on the Isthmus of Corinth, where the Isthmian Games (see **ISTHMUS**) were celebrated in his honor. In art Poseidon has much the same type as Zeus, but without the dignity and benignity of the latter. Statues of him are by no means common. Two of the best are the Poseidon of Melos, now in Athens, and the fine statue in the Lateran, which many regard as derived from the famous bronze on the isthmus, by Lysippus.

At Rome the old Italian or Roman water god, who appears dimly in religious tradition, seems to have been early identified with Poseidon, and during the historical period Neptune is scarcely distinguishable from the Greek god of the sea. A temple to Neptune stood near the Circus Flaminius; his festival, the Neptunalia, was held on July 23. Consult: W. W. Fowler, *Roman Festivals* (London, 1899), O. Gruppe, *Griechische Mythologie und Religionsgeschichte* (2 vols., Munich, 1906), L. R. Farnell, *The Cults of the Greek States*, vol. iv (Oxford, 1907); Georg Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912).

NEPTUNE. The outermost member of the solar system. Its mean distance from the sun is 2,792,000,000 miles; its diameter 34,800 miles, period of revolution about 165 years, mass 17 times that of the earth; density one-fifth of the earth's. Thus, it is about 85 times larger than the earth, but from its extreme remoteness is of almost inappreciable magnitude when seen through an ordinary telescope.

The discovery of Neptune was an event unique in scientific history. It was the disturbance in the motion of Uranus, caused by the attractive force of Neptune, which led to its discovery. From 1690 to its discovery as a planet by Herschel, Uranus (q.v.) had been repeatedly recorded as a fixed star. Earlier observations were found not to agree with later observations, and hence it became evident that either the earlier observations were erroneous or that Uranus was wandering from its ancient track. On Oct. 21, 1845, John Couch Adams (q.v.) communicated to the Royal Astronomer estimates of the elements and position in the heavens of a planet whose mass would account for the orbital irregularities of Uranus. This did not, however, lead to any search for the planet in the heavens, and the matter remained buried in obscurity. In the same year the attention of Urbain Jean Joseph Leverrier (q.v.), a teacher of astronomy in the Ecole Polytechnique, was brought to the Uranian difficulty. In two papers communicated to the French Academy, Leverrier proved that only an exterior body could produce the irregularities in the Uranian orbit. In a third paper, submitted Aug. 31, 1846, he had computed the orbit of the supposed planet, the visibility of which he described as that of a star of the eighth magnitude. These results were communicated to Galle of the Berlin Observatory, with a request to look for the planet in the place assigned to it. This Galle did in the evening of September 23 and perceived a small body with a disk nearly 3 inches in diameter. The place where it was found was within

less than 1° of the spot indicated. Before the news of the discovery reached England, it had already been duplicated. Under the direction of Airy, director of the Greenwich Observatory, Challis of the Cambridge Observatory had commenced a search for the planet July 29 and recorded 3150 stars, three of which were different positions of the planet, recorded on August 4, August 12, and September 29. Challis proceeded to map them, but as he had no good star map this required considerable time, and before this was accomplished news of the discovery arrived from Berlin on Oct. 1, 1846. Neptune had already been seen by Lalande on the eighth and again on the tenth of May, 1795, but was taken to be a fixed star and repeatedly entered in the catalogues as such till its discovery as a planet.

Neptune is attended by one satellite, which was discovered Oct. 10, 1846, by Lassell. This satellite, like the eighth and ninth satellites of Jupiter, Phœbe, the ninth satellite of Saturn, and those of Uranus, differs from the satellites of other planets in the direction of its motion, which is retrograde, i.e., from east to west, in a plane inclined at an angle of 35° to that of the ecliptic. Its period of revolution is 5 days, 21 hours, and its distance from the planet somewhat less than that of our moon from the earth. For an account of Neptune's discovery, consult A. M. Clerke, *History of Astronomy during the Nineteenth Century* (London, 1908). See ASTRONOMY. PLANETS. SOLAR SYSTEM.

NEPTUNE, TEMPLE OF. 1. A remarkably preserved and majestic Doric temple at Pæstum, originally called Posidonia, in Lucania. The temple is a peripteral hexastyle and measures 120 by 85 feet. Within the peristyle the cella has porches, each of two columns *in antis*, at front and rear. The temple stands on a platform of three steps and dates from the latter part of the sixth century B.C.

2. A temple forming part of a group of buildings erected on the Campus Martius at Rome, 26 B.C., by Agrippa in commemoration of the victories at Myse, Naupactus, and Actium. It stood in the midst of a great square surrounded by a colonnade, the Portico of the Argonauts, which was decorated with naval paintings. The whole group was called the Neptunium and was the seat of the Admiralty. It was destroyed in the great fire of 80 A.D. and was restored by Hadrian. Eleven columns of the temple, with a part of the cella and decorated ceiling, are still preserved. See PLATE OF PÆSTUM.

NEPTUNIAN (from Lat. *Neptunus*, relating to Neptune, marine, from Lat. *Neptunus*, name of the Roman sea god). A term formerly applied to the geologists who maintained the aqueous as against the igneous theory of the origin of rocks. The discussions between the two schools were long and bitter. The most prominent advocate of the aqueous theory was the German geologist Werner, who taught at the famous Freiberg School of Mines in the latter part of the eighteenth and the early years of the nineteenth centuries. The theory has long since been superseded by the view that there are two types or classes of rocks—the one originating from igneous agencies and called the massive rocks, and the other resulting from aqueous deposition and known as the sedimentary class.

NEQUINUM. See NARNI.

NÉRAC, nã'rák'. A town in the Department of Lot-et-Garonne, France, on the Baise, 15 miles southwest of Agen (Map: France, S., E 4). The

old town, Petit Nérac, on the right bank of the river is united by bridges to Grand Nérac, the modern industrial quarter on the left bank. The ruins of the imposing royal castle of Henry IV, now numbered among French historical monuments, and the park and promenade of La Garenne along the river bank, are the chief objects of interest, and there is a small museum with remains of a Roman city which once occupied the site of Nérac. Corks, machines, coaches, cloth, brandy, and beer are manufactured, and there is a general trade in wine, grain, and hemp. Here Henry IV, to whom there is a monument, spent his youth. Pop. (commune), 1901, 6435, 1911, 6279.

NERBUDDA, nêr-bûd'â, more correctly **NARBADA, nûr-bûd'â** (Skt. *Narmada*). A river of India, ordinarily considered the boundary between Hindustan proper and the Deccan. It rises in the Maikal Range in the northern part of the Central Provinces and flows southward for 800 miles, emptying into the Gulf of Cambay through an estuary beginning at Broach, 200 miles north of Bombay (Map: India, C 4). In the upper half of its course, below Jabalpur, it flows through a great depression between the Vindhya Mountains on the north and the Satpura Range on the south and is broken by numerous falls and rapids. In this valley, near Hoshangabad, are important deposits of coal and iron ore. In its lower course the river is broad and becomes a tidal stream 50 miles from its mouth. Seagoing vessels ascend the estuary to Broach on favorable tides, and the river is navigable 82 miles for large boats, while smaller ones can ascend 28 miles farther. The Nerbudda is to the Hindus one of the most sacred streams of India.

NEREID (nê'rê-id) MONUMENT. The name given to a sculptured heroon at Xanthus in Lycia, dating from the end of the fifth century B.C. and discovered in 1838 by Sir Charles Fellows. The sculptures from the monument, preserved in the British Museum, show 10 female figures with dripping garments (the daughters of Nereus), which, with the shells and seaweed represented, gave the monument its name.

NEREIDS (Gk. *Nηρηίδες, Nηρείδες, Nêreídes*). Sea nymphs, daughters of Nereus (qv) and Doris, daughter of Oceanus. Their number is variously given, though 50 seems to have been the popular belief. We have, however, in the various lists some 77 different names. Few of them appear as individuals, and of these Thetis, mother of Achilles, Amphitrite, the wife of Poseidon, and Galatea, beloved by the Cyclops Polyphemus, are alone conspicuous. In art they appear frequently as spectators in scenes involving sea deities, as at the contest between Nereus and Hercules or the capture of Thetis by Peleus, while a favorite scene represents them as bringing to Achilles the armor made by Hephaestus. In the later art they appear riding on various sea monsters, sporting with Tritons, or attending on Poseidon and Amphitrite. The name has continued in the popular belief of the Greeks of to-day, but the Nereids are no longer sea maidens, but have become nymphs of the land. The old belief that one who saw a nymph might be smitten with madness reappears in the modern popular superstition, and it is thought dangerous to haunt their caves, and still more to be caught in the whirlwinds of dust raised in their dances. See NYMPH.

NEREIS, nê'rê-is. A genus of annelids

(family Nereidæ) having a long slender body, a distinct head, with tentacles and eyes. Flat lobes (parapodia) on either side in each somite carry leaflike gills. They are all marine and generally hide under rocks or in the sand. They swim actively by rapid and undulating inflections of the body and by the aid of numerous parapodia arranged along the sides. The proboscis is thick, strong, and armed with two jaws.

NEREITES, nê-ré-î-têz (Neo-Lat., from Lat. *Nereis*, Nereid). A peculiar fossil trail found in many of the Cambrian rocks of America and Europe and supposed to have been made by a crawling worm.

NEREOCYSTIS, nê-ré-ô-sis'tis, or **BLADDER KELP**. A genus of the giant kelps of the Pacific coast of North and South America. It has a long flexible stem (stipe) that swells at the end into a large globular float (the bladder), to which are attached large blades.

NERETUM. See **NARDO**.

NEREUS, nê-ré-ûs or nê-rôos (Gk *Νηρεύς*). In Greek legend, an ancient sea divinity, son of Pontus (sea) and Gæa (earth) and father, by Doris, of the Nereids. He seems to have been worshiped at Gythium and probably elsewhere, but his cult was never prominent, and in legend he plays scarcely any other part than father of the Nereids, among whom was included Thetis, mother of Achilles. In the myths he is usually friendly and helpful, and his only contest is with Hercules, who, in order to learn the way to the Garden of the Hesperides, was obliged to wrestle with and hold Nereus, in spite of his manifold changes of shape.

NER'GAL. A prominent deity in the Babylonian and Assyrian pantheons. The name (probably better Nergal) is assured by Hebrew, Aramaic, and Greek transliterations; it is unquestionably Sumerian, its meaning was given by Babylonian scholars as "lord of the great dwelling place," i.e., the nether world, though probably the original significance was "the rage." His original aspect seems to have been that of a solar deity, representing especially the blazing heat of the sun at noon or the summer solstice, thus, he is referred to as "the hero of the gods, the lofty meridian sun." As a destructive deity he became the god of war and the god of pestilence. He shares the former characteristic with Nîmb, along with whom he also appears as the god of the chase. But he appears more uniquely as the god of pestilence, and so he became by an easy transition of thought the god of those whom he destroyed, and thus the deity of the lower world. Accordingly in the later mythology he stood for the declining sun, and the month of Chislew (December) is dedicated to him. This development in the character of Nergal is presented in a story preserved in an Amarna tablet, to the effect that the gods of the upper world became engaged in war with Kesh-kigal, the goddess of the nether world; Nergal as their leader makes his way into her presence, but is induced by her supplications to save her life and to marry her, so becoming the god of the lower world. With this may be compared the classic myth of Pluto and Proserpine. Nergal had also as wife Laz, probably an upper-world goddess. As god of war and destruction, Nergal was identified with the planet Mars, while the lion was his symbol, and the colossal winged lions with human heads at the entrance to the Assyrian

palaces seem to have been called *Nirgallu*. Nergal's ancient sanctuary, with which he was always associated from earliest to latest times, was Cutha, the name of which even became a synonym of the nether world. Accordingly, the Cuthæan colony which was settled in Samaria after the deportation of Israel brought thither the cult of Nergal. (2 Kings xvii. 30.) His cult, however, was widespread, and is found in Syria, as recent excavations show, as early as in the first dynasty of Babylon (2232-1932 B.C.) Consult Morris Jastrow, *Religion of Babylonia and Assyria* (Boston, 1898), id., *Die Religion Babyloniens und Assyriens* (Giessen, 1902-12), Zimmern, in Eberhard Schrader, *Die Keilschriften und das alte Testament* (3d ed., Berlin, 1902), Eduard Meyer, *Geschichte des Altertums*, vol. i, part ii (3d ed., Stuttgart, 1913).

NERI, nâ-ré, **PHILIP**. See **PHILIP NERI**, **SAINT**.

NERIN'EA (Neo-Lat., from Lat. *Nerine*, variant of *Nereis*, Nereid). A genus of siphonostomate gastropods allied to the Cerithiidae and exclusively restricted to the Mesozoic formations, where it is especially abundant in and characteristic of the Jurassic coral beds of Europe. The shell is long and turreted, with many whorls, and the columella always, and usually also the inner lip of the aperture, are ornamented with strong ridges. Longitudinal sections of the shell show that these ridges increase in size and complexity from the apex to the aperture of the shell, in other words, as the shell increases in growth from its young to its adult stage.

NERIS'SA. In Shakespeare's *Merchant of Venice*, the companion of Portia.

NER'RIUM. A subtropical plant. See **OLEANDER**.

NERNST, nêrnst, **WALTER** (1864-). A German physicist, born at Briesen (West Prussia). He studied at the universities of Zurich, Berlin, Graz, and Wurzburg; in 1887 was appointed assistant to Ostwald at Leipzig, and in 1889 lecturer in physical chemistry in the university. In 1891 he became professor at Göttingen, where in 1895 he also organized and became director of the institute for physical chemistry. In 1905 he was called to Berlin to occupy a similar position. In 1906 he delivered a series of lectures at Yale University, which were printed under the title *Experimental and Theoretical Applications of Thermodynamics to Chemistry* (1907). He is the inventor of the Nernst incandescent electric lamp, in which were employed one or more rods or glowers of rare earth oxides, such as zirconia or yttria. These, heated by an auxiliary coil, emit light when incandescent by the passage of the current. Considerable economy was promised for the Nernst lamp in comparison with those with carbon filaments, but the tungsten lamp proved more advantageous. Nernst's publications include *Siede- und Schmelzpunkt*, etc (1893); *Die Ziele der physikalischen Chemie* (1896); *Ueber die Bedeutung elektrischer Methoden und Theorien für die Chemie* (1901); *Einführung in die mathematische Behandlung der Naturwissenschaften*, with Schoenflies (6th ed., 1910); *Physico-chemical Investigations of the Processes of Combustion in Gas Machines*, Russian text (1913); *Untersuchungen über die spezifische Wärme* (1914). See **ELECTRIC LIGHTING**.

NERNST LAMP. See **ELECTRIC LIGHTING**.

NERNST'S HEAT THEOREM. An interesting thermodynamic principle introduced by Walter Nernst and elaborated by Nernst, Planck, and others. The basal idea of the theorem is that a material body cannot possibly be cooled down to the absolute zero of temperature. A number of important consequences follow from Nernst's heat theorem, and among other things it permits of calculating the equilibrium constants of chemical reactions, and therefore the so-called affinities of the reactions, on the basis of certain physical properties of the reacting substances. (See REACTION, CHEMICAL.) Nernst believes his theorem to constitute a third principle of thermodynamics (q v)

NERO (37-68 A.D.). A Roman emperor (54-68 A.D.) He was born at Antium, on the coast of Latium, Dec 15, 37 A.D., and was the son of Cn. Domitius Ahenobarbus and of Agrippina the younger, the daughter of Germanicus Caesar, and sister of Caligula, his name was thus originally L. Domitius Ahenobarbus. His mother afterward became the wife of the Emperor Claudius, who adopted him (50 A.D.), and his name was changed to Nero Claudius Caesar Drusus Germanicus. After the death of Claudius (54 A.D.), the Prætorian Guards, at the instigation of Afranius Burrus, their prefect, declared him Emperor, instead of Claudius' son Britannicus, and their choice was acknowledged both by the Senate and the provinces. His reign began under the guidance of Burrus and his tutor, Seneca, the philosopher. For a time all went well, but the influence of his mother, together with his own moral weakness and sensuality, frustrated their efforts, and he soon plunged into debauchery, extravagance, and tyranny. He caused Britannicus, the son of Claudius, to be poisoned at the age of 14, because he dreaded him as a rival, and afterward (59 A.D.) procured the death of his own mother, Agrippina, to please his mistress, Poppæa Sabina. She was the wife of his principal boon companion, Otho, afterward Emperor, and in order to marry her he divorced and afterward put to death his wife Octavia, the sister of Britannicus (62 A.D.). The affairs of the Empire were at this time far from tranquil. In 61 A.D. an insurrection broke out in Britain among the Iceni under their Queen, Boadicea (q.v.), which was, however, suppressed by Suetonius Paulinus. The following year saw an unsuccessful war against the Parthians in Armenia. At home matters were not much better. The Emperor was lampooned in verse, the Senate and priesthood, alike venal, were also satirized by audacious malcontents, Burrus died, and even Seneca removed from court. In July, 64, occurred a great conflagration in Rome, by which two-thirds of the city were reduced to ashes. Nero himself was charged in ancient times with having been the incendiary (Tacitus, *Annales*, xv, 44); the charge has been often believed in modern days. It is said that he admired the spectacle from a distance, reciting verses about the burning of Troy, but many scholars are doubtful whether he really had any hand in it. At all events, to offset the charge in his own day, and to minimize the popular disfavor caused by this grievous calamity, he laid the blame on the Christians, and persecuted them with great fury. He rebuilt the city with great magnificence, and reared for himself a splendid palace extending from the Palatine Hill over the intervening valley to the slopes of

the Esquiline, called, from the immense profusion of its golden ornaments, the *Domus Aurea* (Golden House). To provide for this expenditure, and for the gratification of the Roman populace by spectacles and distributions of grain, Italy and the provinces were unsparingly plundered. A conspiracy against him failed in the year 65, and Seneca and the poet Lucan fell victims to his vengeance. In a fit of passion he killed his wife Poppæa. He then proposed marriage to Antonia, the daughter of Claudius, but was refused, whereupon he caused her to be put to death, and married Statilia Messalina, after killing her husband. His vanity led him to seek distinction as a poet, a philosopher, an actor, and a musician, and he received applause, not only in Italy, but also in Greece, which, upon invitation of the Greek cities, he visited in 67. In 68 the Gallic and Spanish legions, and after them the Prætorian Guards, rose against him, proclaimed Galba Emperor, and Nero fled from Rome to Phaon. The Senate, hitherto subservient, declared him an enemy of his country, and the tyrant committed suicide. Consult Tacitus, *Annales*, xvi, Suetonius, *Nero*; Schiller, *Nero* (Berlin, 1872), B. W. Henderson, *Life and Principate of the Emperor Nero* (Philadelphia, 1903), the article "Claudius, 28," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. i (8th ed., Leipzig, 1914).

NEROLI, OIL OF. See ORANGE OIL.

NERTCHINSK, nyér'chinsk. A district town in the Territory of Transbaikalia, Siberia, situated on the Nertcha and the Trans-Siberian Railway, 184 miles east of Tchita, the capital of the territory (Map Asia, N 3). It is poorly built. It has a small museum and a library. The inhabitants are engaged chiefly in the cultivation of tobacco and vegetables, and in the fur trade, of which Nertchinsk is still an important centre. The town was founded in 1656 over a mile from its present site. It soon rose to great importance as the centre of the trade with China. With the rise of Kiakhtha (q v) Nertchinsk lost in commercial importance, but it soon became the centre of an extensive mining region and received many immigrants, a considerable proportion being convicts. By the Treaty of Nertchinsk, concluded in 1689, the two rivers of Argun and Gorbitsa and the Stanovoi mountain chain were fixed upon as the boundary lines between Siberia and Manchuria. The mining industry in the vicinity of Nertchinsk is now of secondary importance. Pop., 1897, 6713, including about 1200 exiles, in 1914 it had increased to about 11,300 inhabitants.

NERTHUS. In Northern mythology, a goddess worshiped by the tribes of northern Germany, among whom she journeyed at intervals, bringing peace and fertility. Her shrine was an island, sometimes identified with Rugen. She is also called Hertha, from a former reading of the passage in Tacitus in which she is mentioned.

NERUDA, né'ru-dá, JAN (1834-91). A Bohemian poet, journalist, and novelist, born at Prague. He was educated at the university in his native city, and began to write under the pseudonym of Janko Hovora. His early poetical works belong to the Romantic school, new in Bohemia in his time, and he was influenced by the contemporary movement in the same direction in Germany. His volumes of verse include: *Hřbitovní květy* (Flowers from the Cemetery, 1858); *Knihy věšů* (Book of Verse, 1868);

Písně kosmické (Cosmic Songs, 1878), of philosophic character; *Ballady, a romance* (Ballads and Romances, 1883), written in the spirit of the Czech folk songs; *Prosté motivy* (Plain Motives, 1883), his lyric masterpiece; and the posthumous *Friday Songs* (1896), whose mystic and patriotic ideas are wholly at variance with the beliefs of Neruda's youth. He also wrote several plays of lesser importance. Neruda was connected with various newspapers as editor and contributor, in conjunction with Hálek (qv) he founded the review *Květy* in 1866, and much of his best work appeared in the *Národní Listy*, for which he was feuilletonist and literary and dramatic critic from 1865 to 1891. His prose masterpiece, the studies of middle-class life in Prague called *Malostranské povídky*, was published in 1878. Others of his sketches and novels are: *Arabský* (1864). *Různí lidé* (All Sorts of People, 1871). *Obrazy z ciziny* (Pictures from Abroad, 1872), and *Feuilletony* (1876 et seq.), all remarkable for humor, observation, and a style full of charm. His complete works were edited by Herrmann in 1891-99 (Prague).

NERUDA (NORMANN-NERUDA), WILMA MARIA FRANCISCA (1839-1911). A European violinist, born at Brunn in Moravia, where her father was organist of the cathedral. She became a pupil of Jansa, and made her first appearance at Vienna, in 1846. In 1849 she went to London to play at the Philharmonic in one of De Bériot's concerts. She then returned to the Continent and passed several years traveling as a soloist, chiefly in Russia. In 1864 she visited Paris and played with great success at the Pásdeloup concerts, the Conservatory, and elsewhere. In the same year she was married to Ludwig Normann, a Swedish musician. She returned to London in 1869, again taking part in the Philharmonic, in the winter following she played the first violin at the Monday Popular Concerts; and in 1888 married Sir Charles Hallé, with whom she toured Australia in 1890-91. She visited the United States in 1899. Her tours were a succession of triumphs. She died in Berlin.

NERVA, FORUM OF, or FORUM TRANSITORIUM. The fourth of the Imperial fora at Rome, formed from the highway which separated the Forum of Peace from the Forum of Augustus. As the main thoroughfare between the Subura and the Forum Romanum and between the various Imperial fora (see FORUM), it was called Forum Transitorium or Forum Pervium. It was also called Forum Palladium, from the temple of Minerva (Pallas), of which two Corinthian columns remain, the temple having been destroyed in 1606 to build the chapel of St Paul in the church of Santa Maria Magiore. Consult S. B. Platner, *The Topography and Monuments of Ancient Rome* (2d ed., Boston, 1911).

NERVA, MARCUS COCCEIUS. A Roman emperor (96-98 A.D.). He was born 35 A.D., of a family belonging to Narnia in Umbria, and twice held the consulship before his election by the Senate, at the bidding of the people and the soldiers, to the dignity of Emperor, after the murder of Domitian. He displayed great wisdom and moderation, rectified the administration of justice, and diminished the taxes; he provided also for the maintenance, at public expense, of the children of poor parents in the towns of Italy; but finding himself, on account

of his advanced age, not vigorous enough to repress the Prætorian Guards, he adopted M. Ulpius Trajanus, then at the head of the Army of Germany, who succeeded him on his death, Jan. 25, 98. After his decease he was deified. (See APOTHEOSIS.) Consult the article "Cocceius, 6," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. 1 (8th ed., Leipzig, 1914).

NERVA COCCEIUS, or NERVA MARCUS. See COCCEIUS, NERVA.

NERVAL, nâr'val', GÉRARD DE. A French writer. See GÉRARD DE NERVAL.

NERVE. See NERVOUS SYSTEM AND BRAIN.

NERVE STRETCHING. A treatment of forcibly extending a nerve (neurotomy). It is used in severe, chronic neuralgia of certain nerve trunks (sciatic nerve, trigeminal nerve, etc.) The treatment consists in massage and in certain movements of the affected area or in a surgical operation, by which the nerve is exposed, raised, and stretched for several minutes. See NEURALGIA, SCIATICA.

NERVI, nêr'vê. A town in the Province of Genoa, Italy, situated on the seacoast, 6 miles east of Genoa. It is a favorite winter health resort of the eastern Riviera, with a fine park and promenades. In the vicinity are groves of lemons, oranges, and olives. Pop. (commune), 1901, 6766. 1911, 6745.

NERVII, nêr'vî. An ancient tribe in Gallia Belgica, north of the Ambiani. In the time of Cæsar, who first mentions them (*De Bello Gallico*, i, l. 11, 4-28), they were a warlike people who prohibited trade with their neighbors, forbade the introduction of luxuries, and attempted to make an alliance of the surrounding tribes against the Romans. Cæsar subdued them in 57 B.C.

NERVOUS DISEASE. An affection of any part of the nervous system, either of the brain, spinal cord, sympathetic nerves, or peripheral nerves. Diseases of the nervous system are divided into functional and organic. In the latter local anatomical alteration of nerve structure is apparent. There are in reality no such things as functional diseases. While not seen or described, undoubtedly anatomical changes are present in many cases; and in others there are lesions at a distance which constitute the real disease, while the symptoms which occupy the attention are the result of reflex action. It cannot be affirmed that there are no structural changes in nerve fibres in so-called functional diseases of the nervous system, which constitute the bulk of nervous diseases. There are a large number of special nervous diseases, which may be functional or be associated with lesions in the brain, spinal cord, or peripheral nerves.

Nervous diseases are, first, morbid manifestations of demonstrably disturbed nerve elements, and, second, so-called functional disorders in which actual changes in the physical properties of the nervous system have not yet been discovered. The latter are commonly called neuroses and are steadily tending to enter the former category under improved methods of research. In many nervous diseases heredity is a marked feature, and in the acquired diseases of the nervous system heredity may play a predisposing part.

There is a general belief that nervous diseases are increasing in frequency. Absolute statements, however, are impossible, as many causa-

tive conditions are changing and other newly recognized nervous diseases are being added to the known list. For instance, the infectious diseases, such as smallpox, typhoid, diphtheria, and malaria, are all capable of producing organic and functional nervous diseases. Their control by preventive medicine and hygiene correspondingly reduces that liability. Civilization, on the other hand, by conserving the unfit and prolonging the life of the feeble and neurotic, entails additional nervous disturbances and susceptibilities. There can be no doubt that modern urban conditions favor the development of nervous instability and at the same time bring to bear the additional highly competent noxious influences of vice, particularly through alcoholic and drug habits and venereal diseases. Yet statistics collected in 1914 by the National Education Association apparently show that in early life at least, mental defectiveness is considerably higher in the country than in large cities. Figures gathered from 25 cities and rural districts gave an average of 0.8 per cent of mental defect in rural children as compared with 0.2 per cent in city children. Inbreeding, together with bad hygienic surroundings, probably accounts for the poor showing, both mental and physical, made by rural school children. The monotony and hardships of farm life, however, are also a factor of morbidity and are particularly active among the women so situated. Some occupations bear either a direct or predisposing relation to nervous ailments. Writer's cramp and the entire group of occupation neuroses of which it is a type show this feature. Workers in metal, especially lead, phosphorus, mercury, arsenic, those subjected to inhalation of various gases, and those whose occupation tempts them to indulge in liquors, are liable to nervous disorders. Work entailing exposure to cold or wet or increased atmospheric pressure, and that attended by great mental strain or monotony, furnish predisposing factors.

In their proper place are found articles on the following nervous diseases or conditions: APOPLEXY, CAISSON DISEASE, CATALEPSY; CHOREA; EMBOLISM, EPILEPSY, FACIAL NEURALGIA, HYSTERIA, INSOMNIA, LOCOMOTOR ATAXIA, MENINGITIS, MYELITIS, NEURASTHENIA; NEURALGIA, NEURITIS, NEUROSIS (including occupation neuroses), NEUROTIC, PARALYSIS, THROMBOSIS, ETC. There is also an article on NEUROLOGY. In addition there are articles in the domain of psychiatry, on DIPSO MANIA; INSANITY, KLEPTOMANIA, MANIA, MELANCHOLIA, MONOMANIA; PARANOIA, PARESIS, PYROMANIA, PUERFIL insanity, ETC, as well as on IDIOCY and IMBECILITY.

NERVOUSNESS. A condition of unstable nervous equilibrium, which is largely tempera-

mental. A person afflicted with nervousness startles easily at sudden sounds, is unduly emotional, lacks poise and self-possession. If the condition go beyond these limits, actual disease is present and the person is a neurasthenic, i.e., a sufferer from nerve exhaustion. This state is characterized by unfounded feelings of apprehension, tremor, headache, disordered digestion, insomnia, loss of power of application, and irritability. Overwork, excesses, and disease may cause nervousness in normally stable people, which disappears when the cause, often obscure, is removed. See NEURASTHENIA.

NERVOUS SYSTEM, EVOLUTION OF THE. The nervous system comprises those tissues that have the property of irritability or of sensitiveness to external influences, and whose function it is to mediate between the outer world and the inner and to convey to the muscles and other organs motor impulses so as to bring about movements harmonious and advantageous to the organism. In the nervous system also are centered those phenomena which we designate as thought, reason, will, etc. The origin of the nervous system is apparently independent of that of the muscular system, but the development of nervous tissue accompanies that of the contractile organs. In the most primitive organisms, such as the amœba, the whole protoplasm of the animal body is sensitive to external influences; there is a diffuse irritability. Thus, the whole body of the amœba moves away from strong light. Moreover, it has the ability to move with reference to objects that stimulate it in some physical or chemical way.

Lower Invertebrates. In the Metazoa the nervous system develops in the ectoderm or outer layer of the body wall, which is the region that comes in contact with the outside world and hence is the one in which we should expect sensitiveness to become first developed and localized. Some of the cœlenterates have in the ectoderm superficial sensory cells with which the nerve cells are in contact. Fibres from the nerve cells connect in turn with the fibrillar part of the muscle cells. In the flatworms the nervous system is almost completely separated from the epithelium and lies in or close under the dermal musculature, and a brain is best developed in some of the Polycladida and some trematodes. The nervous system of echinoderms has a development unknown in other animals. It is composed of three independent systems: (1) the superficial oral, (2) the apical oral, and (3) the deeper oral. The superficial oral consists of a ring around the œsophagus and of radial nerves which branch out from this ring to the arms and radii. This system innervates the intestine, ambulacral feet, and integument. The nervous system of Mollusca is of a complex type of its own, but shows some affinities to that of annelids and arthropods. In its simplest form (chitons) it consists of a cerebral part, from which four pairs of commissures are sent off. Passing ventrally from it there is a ring with ganglia, and passing backward two pairs of commissures, one called pedal and the other pallial. All of these contain ganglion cells along their whole length and send off various branches and commissures. The pallial commissures are united posteriorly. In the Pelecypoda the nervous system is somewhat more complex, but it is always symmetrical and consists of two ganglia, the cerebropleural, one on each side of the gullet and united above by a commissure. Each ganglion gives off a nerve

cord, which passes downward and backward to the bilobed pedal ganglion of the foot. Directly backward from the cerebral ganglia also proceed two other cords to the bilobed, fused, visceral ganglion, situated on the ventral side of the posterior adductor muscle, this ganglion sends out branches to the palps and mantle. The pedal ganglion innervates the foot, the viscera, the enteric canal, the heart, the gills, and a part of the mantle. The nervous system of gastropods varies in the different groups both in regard to the arrangement of the ganglia and the commissures. There is usually a pair of ganglia near together or some distance apart, which lie above the gullet and produce the visceral nerve cords behind. The visceral cords pass eventually into a pair of ganglia, but only after they have passed through the pleural ganglia. Pedal and buccal ganglia with their commissures also exist.

The nervous system of annelids is well developed and has a bilateral and metameric arrangement. It consists of the bilobed cerebral ganglion or brain and of a double ventral chain of ganglia and commissures. The brain lies in the prostomium or a little farther back, as in the case of the earthworm. Branches are given off from it to the eyes, tentacles, and sensory epithelium. Two lateral commissures from it pass ventrally around the alimentary canal and unite below it into the double ventral nerve chain. One ganglion occurs in this nerve chain for each segment. In some forms the halves of the chain are widely separated and are united by transverse commissures. The arrangement of the nervous system of arthropods is essentially like that of annelids. There is a supracæsophageal ganglion or brain that gives off commissures which pass downward and backward to unite with the first ganglion of the ventral nerve chain. Various degrees of concentration of the nervous system occur throughout the Crustacea and the insects. The higher Crustacea, as well as the insects, have a visceral nervous system. The brain of insects is relatively large and is lobed.

Vertebrates. The nervous system of the higher vertebrates consists of a double chain of ganglia lying in the median line on the dorsal side of the body, which consists of the spinal cord and the brain. The segmental origin of the spinal cord is shown by the regular repetition of the spinal nerves that branch out from it in pairs, one on each side. The visceral or sympathetic system of vertebrates consists of a series of ganglia on each side of the vertebral column. Fibres connect this system with the spinal and cranial nerves. Nerves from the neural axis pass to all the various sense organs, muscles, and glands. The spinal cord is made up of two kinds of nervous matter, a superficial white layer and an internal H-shaped rod of gray matter. The cord merges gradually into the brain, which has a bilateral form and consists, in its simplest form, of three parts, the forebrain, midbrain, and hindbrain. The two lobes of the cerebrum comprise the most anterior part of the brain. The midbrain connects the fore and hind brain. The hindbrain includes the bilobed cerebellum on its dorsal side and the pons Varolii and medulla oblongata on the ventral side. The brain is made up of two kinds of nervous matter, the white and the gray. Its surface is much convoluted, so as to give a greater surface for the gray matter which forms the outer coating. The cranial nerves arise from the lower surface of the brain.

The brain of the Acrania (*Amphioxus*) is the enlarged anterior end of the neural axis, and in it the central canal enlarges to form the ventricle. The ventricle opens dorsally to the exterior of the brain. Anterior to the opening there is a pocket known as the olfactory lobe. The brains of cyclostomes and teleosts represent a low stage of development in that they possess an unpaired prosencephalon whose dorsal wall, the cortex cerebri, consists of a single layer of cells covered by the pia mater. In the larva of cyclostomes (*Ammocetes*) the metencephalon is the largest part of the brain. Selachians possess a more complicated brain. They lead an active, predatory life, and correspondingly the prosencephalon is relatively large and shows a slight furrow or division into two lateral parts or lobes. A prominent pair of bulbi olfactorii pass from in front to the nose. The thalamencephalon gives rise to two small optic thalami, and there are other modifications in the rest of the brain which render it a more complex organ. There is a bundle of fibres from each side of the prosencephalon that probably corresponds to the crus cerebri of mammals. The brains of ganoids and dipnoans resemble those of amphibians in the absence of the lobi inferiores. In all three the cerebral hemispheres show a marked development. The cerebellum exists only as a small fold at the anterior end of the medulla. In the Anura the optic lobes are well developed.

In Reptilia, as in Amphibia, the cerebellum is small. A well-developed median eyelike structure, the pineal eye, is present on the roof of the midbrain. The prosencephalon is the largest part of the brain. It is paired, and its surface is smooth. There is a large olfactory lobe and a well-developed corpus striatum. The avian brain is characterized by a considerable cranial flexure, by large cerebral lobes, by a cerebellum. In sagittal section the latter shows the arbor-vitæ structure so evident in the brain of man. Externally the brain is folded transversely or convoluted. The mammalian brain exhibits in the different groups a steady growth in complexity from the reptilian to the human condition. The cranial flexure is most pronounced in the mammalian brain.

That the degree of development of the different organs within the group of mammals is dependent upon their functional activity can hardly be doubted. Thus, the pyramids are the motor nerves coming from the coordinating centres of movement. These are relatively small in the dolphins, which possess no hinder extremities. The frontal lobe of the cerebrum, upon which probably many of the higher functions, such as speech, depend, are best developed in man; so, too, the olfactory lobes are reduced in man in correspondence with the rudimentary condition of their function in man. While the midbrain is more or less exposed in some of the lower mammals (e.g., marsupials, rodents, and insectivores), the hemispheres come gradually to cover the entire brain. The mammalian brain is characterized by the presence of large commissures, the corpus callosum and fornix, which connect the hemispheres. The pons Varolii is another large commissure and connects the two lateral lobes of the cerebellum, and a number of other bands serve as connectives. In mammals the midbrain is relatively smaller than in other vertebrates. The brain of Tertiary mammals was relatively small. The reduction was especially evident in the hemispheres. In many points of

structure their brain, too, was reptilian in character, although the possessors were related to groups as high as ungulates.

Three main and well-defined types of nervous system may be determined in the animal kingdom. There is first the radial type, such as has been described for the starfish. This consists of a ring of nervous tissue in the disk which surrounds the œsophagus and sends out a branch to each arm. This is the echinoderm type. Another type is the symmetrical, bilateral type of annelids and arthropods, to which the nervous system of mollusks may also be relegated. This type consists of a brain ganglion above the œsophagus, with commissures that pass around and below the digestive tract, where they unite ventrally with a chain of ganglia extending posteriorly. The pedal ganglion of mollusks represents the subœsophageal ganglion. The rest of the ventral chain is absent in unsegmented mollusks. The third type of nervous system is the bilateral type of vertebrates. Here the double nerve cord, segmental in origin, as is shown by the repetition of paired spinal nerves, lies on the dorsal side of the alimentary tract. Except in *Amphioxus* the vertebrate nerve cord widens anteriorly into a large and complex ganglion mass, the brain. The sympathetic system, which appears first in leeches and arthropods, is an almost independent nervous system, for while it is in direct union with the other nervous system, it is not at all under its control.

Sense Organs. As soon as sense organs appear the nervous elements of animals consist of three parts. (1) the so-called terminal, end, or sense organ, (2) the ganglia, and (3) the nerves. End organs appear first clearly defined in the Cœlenterata, although the pigment spots of *Euglena* are in a particularly sensitive region in that infusorian. The sense organs of the Cœlenterates are most developed in the medusæ and consist of the tentaculocysts with calcareous lithites, pigment spots or ocelli, and sensory pits known as olfactory pits. Pigment cells or eyespots are found in many of the flatworms, some of the polyclads possessing several hundred. These eyes, in many forms, are grouped in pairs at the anterior end of the body or are scattered along the anterior margin or even along the entire margin of the body. In many forms the eyes are simple pigment spots. In others a refractive body occurs. In triclads and polyclads the eye consists of a pigmented apparatus with retinal or light-perceiving cells within a cup-shaped organ. These cells connect with the optic nerve. Auditory organs also occur in the flatworms, each consisting of a fluid-filled sphere lying close to the brain in which is an otolith. The skin is everywhere very sensitive, owing to tactile hairs, especially on the tentacles. The proboscis of certain forms contains an invagination which is capable of extrusion and is believed to be a touching organ. The suckers of trematodes, too, are especially sensitive. There are ciliated pits in the epithelium of triclads and other forms to which an olfactory function has been ascribed.

Sense organs occur over the whole integument of mollusks. These cells, when in exposed positions, may have a tactile function. The pallial sensory organs and the osphradium, which occur near the gills, are probably olfactory organs to test the condition of the water. The optic tentacles of pulmonates and the dorsal tentacles of opisthobranchs are stated by some authorities to be olfactory organs. Ciliated ridges

in the mantle furrows of certain chitons are supposed to have an olfactory function. Auditory organs are absent in the Amphineura alone among mollusks. The auditory organ consists of a closed, fluid-filled vesicle, or otocyst, in which a varying number of otoliths are inclosed. Sensory cells occur on the wall of the otocyst, which bear sensory hairs. The otocysts of cephalopods have been shown to have a statical function also. The simplest visual organs of mollusks are optic pits. The retina lies at the base of the pit, and along this base the optic nerve spreads out. The retina consists of cells with and without pigment. External to the retina is a gelatinous cuticle or even a lens. By the approach and fusion of the edges of the pit the vesicular eye is formed. That part of the epithelium which is free from pigment constitutes the cornea. This type of eye occurs on the tentacles of gastropods. By a further development the simple cuplike eye is differentiated into the complex, highly developed organ of cephalopods. The mantle eyes of the scallop resemble vertebrate eyes in that the visual rods are turned away from the light, that is to say, they are directed towards the body.

The sense organs of echinoderms comprise the auditory organs and eyes. The auditory organs are of two types. The first type is represented in holothurians and consists of an otocyst which is lined with ciliated epithelium, container and otolith, and filled with fluid. In echinoids is found the second type of auditory or orienting organs, which are believed to be transformed spines. Organs of this type are known as sphaeridia and are developed only on the oral side; they are spherical, stalked bodies and may be inclosed in a pit of the test. The organs of special sense in the annelids are the eyes, tentacles, cirri, and otocysts. The structure of the eye, when that organ is present, is very simple. The eyes are confined to the prostomium, but there are eyelike organs on many or all the body segments or on the branchial filaments of many species. Eyes are lacking in nearly all Oligochaeta and some of the Polychaeta. The eye is usually a capsule with a layer of elongated cells on the side towards the brain. A thickening of the cuticle may form a lens. Otocysts with otoliths are not common. Tactile cells occur generally all over the body and especially on the prostomium.

The organs of special sense in arthropods are eyes, olfactory setæ, auditory organs, and organs of touch. The eyes are of two sorts, median eyes and a pair of faceted, compound eyes. The median or nauplius eyes sometimes occur in the larvæ only and are composed of a cuticular lens and a group of specially modified epidermal cells. The paired, compound eyes are covered by a transparent cuticle. A single visual element of the compound eye is called an ommatidium. Each element is composed of two parts, an outer vitreous and an inner sensory group of cells. The latter is known as the rhabdome and is made up of the retinule and a refracting rod. Each ommatidium is in a state of optical isolation. Fibres pass from the optic ganglia to the retinule. The organs of touch are bristled cells on the appendages, especially on the antennæ, the palpi, and on other parts of the body. The olfactory organs of the crayfish consist of a number of delicate setæ borne on the antennules. The auditory organ is a pit upon the exterior, and is lined with auditory setæ. Grains of sand

in the case of Crustaceæ often serve the function of otiliths. These must be renewed after each molt.

Amphioxus possesses an olfactory pit. It is a ciliated depression at the level of the anterior end of the brain. It is connected with the olfactory lobe of the brain. This pit may correspond with the pituitary body of Urochorda and Craniata. The organ of sight is merely a pigment spot. It is median and without a lens. Cells supposed to have a sensory function occur on the roof of the oral hood, and tactile cells occur on the buccal cirri.

The organs of special sense of vertebrates comprise various kinds of tactile organs, of which may be mentioned the lateral-line organs, which in structure resemble the organs of chertopods. The lateral-line organs occur in amphibians and fishes and are supposed to perceive vibrations in the water and also to have an auditory function. End-bulb organs likewise occur here and there over the entire surface of fishes. From amphibians upward they are restricted to the mouth. Specialized tactile cells, such as the Pacinian corpuscles of the duck's beak, occur in different vertebrates.

The olfactory organ in fishes is a pair of sensory pits near the anterior end of the snout. From the Dipnoi onward these pits communicate with the mouth cavity as well as with the exterior. From the Dipnoi onward also these organs are more or less inclosed either in a cartilaginous capsule or they are included in the cranium. The internal nostrils with their glands are developed in Dipnoi and Amphibia. The nasal cavity of Lacertilia is divided into an outer and an inner part. From the crocodiles onward the nasal organs recede in correspondence with the forward extension of the facial region. Both in reptiles and birds there is only one true turbinal bone in the nasal canal. Because of the extreme facial development of the skull of mammals, the nasal cavity is proportionately larger. The turbinals consequently greatly develop here. The nasal cavity of mammals communicates with certain sinuses of the face.

The sensitive elements of the vertebrate eye develop from outgrowths, primary optic vesicles, of the brain. The pigment epithelium develops from an inpocketing of this vesicle. The lens develops from thickened epidermal cells. In cyclostomes the lens and iris are absent and the sclerotic and cornea are undifferentiated. A globular lens is present in the eyes of true fishes. Amphibian eyes are simpler than those of fishes, but a ciliary muscle is present. The sclerotic is cartilaginous with bony plates even in lizards and birds. The eyeball of nocturnal birds is elongated and tubular. The iris of birds may be highly colored, owing to the presence both of pigment and of fat globules. The eye of mammals is more or less inclosed in the bony orbit, the sclerotic is fibrous, and the fibres of the optic nerve pass into the retinal cells. The retina is histologically a complicated structure and consists of seven layers; the light must pass through all the layers in order to reach the innermost rod and cone layer. The region of acutest vision is the fovea centralis, where only the cones persist.

As to auditory organs, it is the sacculus and cochlea in the vertebrate ear that attain a higher and higher degree of development. In fishes the cochlea is a knoblike appendage of the sacculus.

In amphibians it is constricted off from the sacculus and only remains connected by a strand of cells. In mammals the cochlea becomes spirally coiled. There are three coils in man. A chain of three auditory ossicles appears in the higher vertebrates.

S. Kingsley, *Text-Book of Vertebrate Zoology* (New York, 1899); R. E. E. Wiedersheim, *Comparative Anatomy of Vertebrates*, translated by W. N. Parker (3d ed., ib., 1907), and, for a popular but reliable review, the chapter on "The Nervous System," in G. H. Parker, *Biology and Social Problems* (Boston, 1914).

NERVOUS SYSTEM AND BRAIN. Historical. It is impossible in an article such as the present to do more than touch upon some of the more important investigations which have brought us to our present conception of the nervous system. Up to the eighteenth century very little progress was made in the study of the structure of the nervous system, though some work was done upon the gross anatomy of the brain by men whose names remain to us in our anatomical nomenclature. Thus, Vesalius, Fallopius, and Eustachius were among the earliest. To the philosopher Descartes in the earlier part of the seventeenth century belongs the honor of the first recorded description which gives any intelligent conception of the structure of the nervous system. His drawings of the brain possess a very fair degree of accuracy as regards general shape, though the lobes and convolutions appear much distorted. He pictured the nerves as originating in the brain and described their function as the carrying of the animal spirits from the brain to the periphery. In the seventeenth century we have Willis, whose name we recognize in the circle of Willis, and who described the basal ganglia, the pyramids and the olives, and enumerated nine pairs of cranial nerves. Vieussens, whose name is familiar in the valve of Vieussens, and DuBoise, whose medical cognomen of Sylvius marks that prominent sulcus of the cerebrum. The results of the labors of these investigators, as well as those of Van Leeuwenhoek, Malacarne, Rolando, Vico d'Azyr, Arnold, Monro, and others, were collected and summed up in an extensive volume published by Burdach in 1819. Von Sömmering made very important researches on the brain, eye, and ear, recognizing 12 pairs of cerebral nerves (1796). Descartes had discovered the nerve fibre, and the next step forward in the histology of the nervous system was not taken until Ehrenberg in 1833 discovered the nerve cell in the spinal ganglia. This discovery was emphasized when four years later Purkinje observed the presence of cells not only in the ganglia, but in the cerebrum and cerebellum. The important fact that the dorsal roots of the spinal nerves are concerned with sensation and the ventral roots with motion was discovered by Sir Charles Bell, an eminent British surgeon and anatomist, and communicated by him to the Royal Society of London in 1822. In 1838 Remak discovered that the cells of the sympathetic ganglia had processes, and that these were connected with nerve fibres. The importance of this discovery, confirmed in 1842 by Helmholtz, was not at the time ap-

preciated. One of the most careful studies of nerve cells and their processes was made by Otto Deiters of Bonn and published after the investigator's death by Max Schultze in 1865. Deiters divided the processes given off from nerve cells into two kinds—protoplasmic processes, which branched rapidly and the structure of which resembled that of the cell body, and axis cylinder or nervous processes, which were often continuous with the axis cylinders of medullated nerves. Gerlach's publication in 1872 was far-reaching in its influence. By the use of the chloride-of-gold method, he was able to demonstrate many more and finer processes of nerve cells than had been recognized by the older methods of staining. These delicate processes were believed by Gerlach to form a diffuse nervous network within the gray matter. Besides describing this nervous network, Gerlach formulated on this basis a theory of nervous-system structure which was accepted by most neurologists until the advent of the so-called newer investigations. Gerlach believed that from the anterior horn cells of the spinal cord processes passed directly off to form the motor roots of the spinal nerves. According to his theory the protoplasmic processes of these cells ramified in the gray matter of the cord, where they anastomosed with protoplasmic processes from other cells, forming a reticulum from which arose the fibres which passed out of the cord as the posterior or sensory roots. Gerlach believed that this same relation of afferent and efferent fibres to the nerve cells and to the reticulum obtained throughout the entire nervous system, which thus consisted of a remarkably complex continuum of nervous protoplasm.

The so-called newer investigations upon which is based our present conception of the structure of the nervous system must be considered as beginning with the discovery by Golgi of his staining method. This was announced in 1873, although it was not until 10 years later, when Golgi published a considerable volume of his investigations, that the neurological world began to realize the importance of his discovery. To the later investigations of Golgi, His, Kolliker, Van Gehuchten, Forel, Retzius, Ramón y Cajal, Von Lenhossek, Flourens, and others must be ascribed the overthrow of Gerlach's theory of a diffuse nervous network and the practical establishment of the now accepted neuron theory of nervous-system structure.

Methods of Neurological Investigation. The history of the development of our knowledge of the structure of the nervous system is necessarily intimately associated with the history of advances in methods of investigation. Among the general methods which have proved of greatest value in working out the structure of the nervous system the following may be mentioned: (1) *Method of Anatomical Dissection*.—Only the coarser fibre tracts can be determined by this method, its main use being in studying the gross anatomy of the nervous system. (2) *Method of Embryology*.—The extreme value of this method is shown by the important investigations of His. By means of this method it is possible to study the development of the neuron from its first appearance to its adult condition and to observe how groups of neurons become separated off by themselves to form the different parts of the nervous system. Of especial importance is the fact that the fibres of different systems of neurons

acquire their medullary sheaths at different embryonic ages. In this way it is possible, by studying the nervous systems of embryos of different ages, to distinguish many of the fibre systems. (3) *Method of Pathology*.—This is based upon the fact that any disease or injury which destroys the cell bodies of neurons, or which interrupts the continuity of their axons, causes degeneration in the axons whose cells are destroyed or whose continuity is interrupted. Thus, e.g., in an injury crushing the spinal cord at a certain level, there will be found degenerated above the point of injury all fibres whose cells lie below the injury, while below the injury there will be found degenerated all fibres whose cells lie above the injury. More recently it has been determined that not only does the distal portion of a cut nerve or cut fibre tract die, but that in disease of peripheral nerves changes take place in the central stump and in the cells from which the diseased axons originate. It has thus been possible in some cases to determine the cells from which diseased nerves spring. (4) *Method of Arrested Development*.—This method depends upon the fact that there sometimes occur abnormalities in the nervous system, such as absence or malformation of a part, thus causing an absence of development in other parts dependent upon them. (5) *Method of Animal Experimentation*.—This method consists essentially in subjecting animals to certain conditions which cause changes in the nervous system and then studying those changes.

Most of our knowledge of the nervous system has been acquired by the application to these general methods of certain special staining methods. Of these the four most important are the methods of Weigert, Golgi, Nissl, and Ehrlich. For the details of these methods the reader is referred to textbooks on histology and histological technique.

ANTERIOR PORTION OF THE BODY OF A CHICK

The head distinctly differentiated, seen from the surface. *H f*, head fold, *Neu por*, neuroporus, *H p*, head plate; *F g*, foregut, *Y ve*, yolk vein, *Med. gr*, medullary groove; *Ant. cerebr. ves.*, anterior cerebral vesicle, *Mid. cerebr. ves.*, middle cerebral vesicle, *Post. cerebr. ves.*, posterior cerebral vesicle.

Development. The differentiation of the nervous system begins very early in embryonic life. There is first the formation of a groove or furrow in the outer layer of the blastoderm. This is known as the medullary or neural groove. By an increase of the cells at the sides of the groove and their union dorsally, this groove is converted into a closed canal, the neural or medullary canal. This canal corresponds to the central canal of the spinal

cord and to the ventricles of the brain in the adult nervous system, and it is from the epiblastic cells surrounding the medullary canal that the entire nervous system is developed. At that end of the canal which corresponds to the head of the embryo, three dilations appear. These are known respectively as the forebrain (anterior cerebral vesicle—telencephalon), the midbrain (middle cerebral vesicle—mesencephalon), and the hindbrain (posterior cerebral vesicle—metencephalon). These three vesicles soon become five from the development from the forebrain of the interbrain or diencephalon, and from the hindbrain of the afterbrain or myelencephalon. From the anterior cerebral vesicles are developed the cerebral hemispheres, the corpus callosum, the corpora striata, fornix, lateral ventricles, olfactory bulbs, and the optic thalamus. From the middle cerebral vesicle are developed the corpora quadrigemina, the crura cerebri, and the aqueduct of Sylvius. From the posterior cerebral vesicles are developed the cerebellum, pons, and medulla oblongata. From

nerve cell with all its processes is known as the neuron.

Nervous Tissue. The structural element of nervous tissue is the neuron. This has already been defined as the nerve cell with all its branches. These neurons in their association with one another to form the organs of the nervous system are supported by a peculiar type of connective tissue called neuroglia. As noted before in describing its development, each adult neuron consists of a cell body and two kinds of processes, the axis cylinder and the dendritic processes. The cell body, as in most other cells, consists of a mass of protoplasm containing a nucleus.

Our knowledge of the internal structure of the nerve cell has been greatly enhanced within the last few years by the application of a new staining process known as the method of Nissl. This consists essentially in placing fresh tissue in some quick fixative such as absolute alcohol, staining sections with such a dye as methylene blue, and using a differentiating fluid composed of colorless aniline oil and alcohol. This method demonstrates two very different types of cell in the nervous tissues. In one of these the nucleus alone stains, in the other both nucleus and cell body are stained. The former are known as caryochrome cells, the latter as somatochrome cells. The structure of a somatochrome cell as shown by the method of Nissl is as follows. The rather large nucleus situated in the centre of the cell resembles the nuclei of other cells, being surrounded by a nuclear membrane and traversed by an intranuclear network, both of which stain blue. The nucleoplasm, or basement substance of the nucleus, remains unstained. Within each nucleus is a darkly staining nucleolus. The body of the cell shows three distinct elements in its structure—a basement substance, a cytotreticulum or fibrillar element, and chromophilic bodies. The basement substance is unstained by Nissl's method and appears homogeneous. Traversing this basement substance may be seen very delicate fibrils. This fibrillar structure extends not only throughout the body of the cell, but also into the dendrites and the axis cylinder, possibly as far as these processes themselves extend. The chromophilic bodies are blue-staining, granular masses scattered throughout the cell body. The size and arrangement of these bodies differ greatly in different cells, and are quite characteristic for certain types of cells. In addition to the elements already described, there is

TWO FORMS OF MULTIPOLAR NERVE CELLS

From the ventral horn of the spinal cord of a newborn rabbit, showing the richly branched protoplasmic processes. (Schafer)

present in many nerve cells more or less yellow or brown pigment. This pigment is absent in the nerve cells of the newborn child. The internal structure of the dendrites is similar to that of the cell body. They usually branch rapidly and end in the gray matter near their cell of origin. The method of Golgi shows them to be covered with little knoblike projections known as gemmules. The axon differs from both cell body and dendrites in that it contains no chromophilic bodies. It arises from a portion of the cell called the axon hill, which is also free from chromophilic bodies. In Golgi preparations the axon is distinguished by its fineness, its straight course, approximately uniform diameter, and its few branches. These few branches pass off at right angles and

are known as collaterals. In some cells the axon branches rapidly and ends in the gray matter near its cell of origin. Other axons pass into the white matter and become axis cylinders of nerve fibres. At its origin from the cell body and at its termination, the axon is uncovered by any sheath. Some axons—confined to the gray matter—are entirely devoid of any covering. Other axons—fibres of Remak, found mainly in the sympathetic system—are covered by a delicate sheath known as the neurilemma or sheath

of Schwann. The axons of the white matter of the brain and cord are protected by a thick sheath called the medullary sheath. The axons of the peripheral cranial and spinal nerves are covered by a medullary sheath and outside of this a neurilemma. Such axons, with their sheaths, are known as medullated nerve fibres. A medullated nerve fibre thus consists of a central core or axis cylinder which is continuous throughout the fibre and is the axon of a nerve cell. This axis cylinder is covered by a rather thick sheath of a fatty nature known as the medullary or myelin sheath, outside of which is the delicate neurilemma. From the neurilemma fine septa, called the incisures of Schmidt, extend into the myelin. At intervals the medullary sheath is interrupted and the axis cylinder is uncovered or covered only by the neurilemma. These points are known as the

MEDULLATED NERVE FIBRES (OSMIC ACID).

nodes of Ranvier, and the portion of the nerve fibre between two nodes as an internodal segment.

As to the physiological significance of these different parts of the neuron, our ideas are still based largely upon theoretical grounds. The cell body has been shown to be the birth or genetic centre of the neuron. From the fact that any portion of the neuron which is cut off from the cell body dies, the cell would seem to be the nutritive or trophic centre of the neuron. From the absence of nervous activity in portions of the neuron which have been cut off from their cell of origin, the cell body would also appear to be the functional centre of the neuron. The most generally accepted theories of the significance of the component parts of the cell itself may be summed up as follows. The function of the nucleus is to preside over the

constructive activities of the neuron, by which food products brought to the cell by the lymph are transformed into food elements of the cell, and finally into its nervous elements proper. The basement substance and the chromophilic bodies represent the food elements of the cell. The cytotreticulum represents the working nervous mechanism of the cell, it alone being concerned in the reception, transformation, and emission of the nervous impulse. Of the processes, the axon is centrifugal in function, carrying impulses away from the cell body, the dendrites are centripetal in function, bringing impulses to the cell body. Neurons are associated with one another by approximation or by contact, and not by continuity of their protoplasm, i.e., no two neurons are believed to be directly connected with each other. The axonal terminations of one neuron simply lie in contiguity, or at most in touch, with the dendrites or cell bodies of other neurons, the impulse passing over from one to the other.

Neuroglia, or the connective tissue of the nervous system, differs both in structure and in origin from the connective tissue found in other organs. As already stated, it is epiblastic in origin, developing like the neuron from the cells which line the embryonic neural canal. These cells, at first morphologically identical, soon differentiate into neuroblasts, or future neurons, and spongioblasts, or future neuroglia cells.

In adult neuroglia two main types of cells are found, spider cells and mossy cells. The spider cell has a rather small body, from which are given off on all sides straight, unbranching, spinelike processes. They occur mainly in the

CELLS FROM SECTIONS OF THE BRAIN OF ADULT MAN.

a, mossy cell, b, spider cell

white matter. The mossy cell has a rather large body. Its processes are fewer, are coarse, rough, and branching, they occur mainly in connection with blood vessels. As in the case of the nerve cell, the processes of these cells do not anastomose, but interlace.

In all vertebrate animals the nervous system is composed of two distinct portions or systems, viz., the cerebrospinal and sympathetic or ganglionic.

The *cerebrospinal system* includes the brain and spinal cord (which form the cerebrospinal axis, or central nervous system) and the cranial and spinal nerves. It was termed by Bichat the nervous system of animal life, since it presides over such distinctly animal functions as sensation, motion, and intellect, and comprises all the nervous organs concerned in sensation, volition, and mental action.

The *sympathetic system* consists essentially of a chain of ganglia connected by nervous cords, which extends from the cranium to the pelvis,

along each side of the vertebral column, and from which nerves with large ganglionic masses proceed to the viscera and blood vessels in the cavities of the chest, abdomen, and pelvis. It was termed by Bichat the nervous system of organic life, since it seems to regulate—almost or quite independently of the will—the due performance of the functions of the organs of respiration, circulation, and digestion.

The Central Nervous System. The brain and spinal cord are covered and protected by the *meninges*—three membranes, the *dura mater*,

VIEW OF THE CEREBROSPINAL AXIS

The right half of the cranium and trunk of the body have been removed by a vertical section, the membranes of the right side of the brain and spinal cord have been cleared away, and the roots and first part of the fifth and twelfth cranial nerves, and of all of the spinal nerves of the right side, have been dissected out and laid separately on the wall of the skull and on the several vertebrae opposite to the place of their natural exit from the craniospinal cavity.

Fron. lo., frontal lobe, *Temp. lo.*, temporal lobe, *Occip. lo.*, occipital lobe, *Cereb.*, cerebrum, *Po. var.*, pons Varoli, *Med. obl.*, medulla oblongata, *a* and *b*, upper and lower extremities of the spinal cord, *Cau. eq.* on the last lumbar vertebral spine marks the cauda equina, *Ner. trig.*, the three principal branches of the nervus trigeminus, *C. 1st*, the sub-occipital or first cervical nerve, *C. 8th*, the eighth or lowest cervical nerve, *D. 1st*, the first dorsal nerve, *D. 12th*, the last dorsal nerve, *L. 1st*, the first lumbar nerve, *L. 5th*, the last lumbar nerve, *S. 1st*, the first sacral nerve, *S. 5th*, the fifth sacral nerve, *L. sac. plex.*, the left sacral plexus, *Coc. ne.*, the coccygeal nerve.

the arachnoid, and the pia mater. The *dura mater* is a strong fibrous membrane, which supplies the cranial bones with blood in early life and adheres firmly to their inner surface. The arachnoid (so called from its being supposed to be as thin as a spider's web) consists of a parietal and a visceral layer. The parietal layer adheres to the inner surface of the *dura mater*, while the visceral layer somewhat loosely invests the brain and spinal cord, from direct contact with which, however, it is separated by the intervention of the pia mater and some loose areolar tissue. The pia mater is an ex-

tremely vascular membrane, consisting of minute blood vessels, held together by fine areolar tissue. It dips down between the convolutions and fissures of the brain, and is prolonged into the interior, forming the *velum interpositum* and the choroid plexuses of the fourth ventricle. By means of this membrane the blood vessels are conveyed into the nervous substance.

The Cerebrospinal Nervous System. In describing this it is more convenient to begin with a description of the spinal cord, the study of which is essential to a proper appreciation of the higher and more complicated centres.

The *spinal cord* is that portion of the cerebrospinal axis which is contained in the spinal canal. It extends from the upper border of the first cervical vertebra or atlas above to the middle or lower margin of the first lumbar vertebra below. The cord is continuous superiorly with the medulla oblongata, while its lower extremity tapers off into a slender cord, the *filum terminale*. At two levels, one in the cervical and one in the lumbar region, the diameter of the cord is considerably larger than elsewhere. These are known respectively as the cervical and the lumbar enlargements. The posterior median septum and the anterior median fissure almost divide the cord longitudinally into two symmetrical halves, while the spinal nerve roots serve to divide it into segments. These segments correspond in number to the spinal nerves. There are thus eight cervical, twelve dorsal, five lumbar, five sacral, and one or two coccygeal segments. The internal structure of the cord can be best appreciated by studying a transverse section through the cervical enlargement stained by Weigert's method. Such a section shows that two substances enter into its composition, one situated centrally, the other on the periphery. On account of their appearance in fresh tissues, the former is called *gray matter*, the latter *white matter*. The gray matter is made up mainly of cells and their dendrites and of nonmedullated axons, the white matter consists mainly of medullated nerve fibres, its whiteness being due to the myelin. The gray matter is distributed somewhat in the form of the letter H. Posteriorly it is slender and almost touches the surface—posterior horns—while anteriorly it is broad—anterior horns—and separated from the surface by a considerable layer of white matter. The expanded tip of the posterior horn is known as the head or caput, and contains a gelatinous substance, the *substantia gelatinosa* of Rolando. The narrow portion connecting the head with the central gray matter is called the neck or cervix. Laterally the gray matter extends out somewhat into the white matter as the lateral horn or *processus reticularis lateralis*. The gray horns of the two sides of the cord are connected by a commissure containing the central canal. In fetal life this canal is open and continuous with the ventricles of the brain. In adults it is usually more or less obliterated. It is surrounded by the *substantia gelatinosa centralis*, and divides the gray commissure into an anterior gray commissure and a posterior gray commissure. Passing out from the anterior horns to the surface of the cord are bundles of fibres which constitute the anterior or motor spinal nerve roots. Just to the median side of the posterior horns are seen the entering fibres of the posterior or sensory nerve roots.

By the posterior horns the white matter of the cord is divided into posterior columns and anterolateral columns, the latter being again rather indefinitely subdivided by the fibres of the anterior roots into lateral and anterior columns. The posterior columns are also usually subdivided at this level by a connective tissue septum from the pia mater into an internal portion, the column of Goll, and an external portion, the column of Burdach.

Fibre Systems or Tracts of the Cord. As already noted, the cell bodies of the neurons are grouped in the gray matter of the brain and cord in the ganglia of the cranial and of the spinal nerves and in the end organs of certain of the nerves of special sense. This grouping is for definite physiological purposes. The axons from many of these neuron groups pass into the white matter as distinct bundles and constitute fibre systems or fibre tracts. In the normal adult cord these various tracts of fibres present the same appearance and cannot be differentiated from one another. Embryological and pathological studies enable us to distinguish the following systems. 1. Descending tracts: (a) the direct pyramidal tract or column of Türeck; (b) the crossed pyramidal tract; (c) the descending comma tract of the posterior column, (d) the descending cerebellar tract of Loewenthal. 2. Ascending tracts: (a) the column of Goll, (b) the column of Burdach, (c) the column of Lissauer, (d) the direct cerebellar tract, posterolateral ascending tract, or tract of Flechsig; (e) the tract of Gowers, or the anterolateral ascending

region of the cord. In the cervical and dorsal regions it is separated from the surface by the direct cerebellar tract. In the lumbar region the latter tract is no longer present and the

tract. 3. Short systems, fundamental columns or ground bundles, composed of short ascending and descending fibres intermingled.

Location of the Fibre Systems of the Cord and Origin of their Fibres. The direct pyramidal tract occupies a small oval area adjacent to the anterior fissure. It decreases in size as it passes downward and disappears entirely in the middle or lower dorsal regions. The crossed pyramidal tract occupies the posterolateral

crossed pyramidal comes to the surface. This tract extends to the lowermost part of the cord, decreasing in size as it descends. The fibres of the pyramidal tracts are axons of cells situated in the brain in the region of the fissure of Rolando or motor area. These fibres descend through the internal capsule, pons, and medulla. In the medulla they form a large bundle of fibres known as the anterior pyramids, lying on either side of the anterior fissure. At the junction of medulla and cord most of these fibres cross over, in what is called the pyramidal decussation, to the opposite posterolateral region, to continue down the cord as the crossed pyramidal tract. A small number of fibres remain in the anterior region and pass down the cord as the direct pyramidal tract. Both tracts as they descend send collaterals and terminals into the gray matter of the anterior horns, where they end in arborizations around the motor cells there situated. These tracts thus constitute the motor pathway connecting the brain and cord, carrying voluntary motor impulses from the brain to the cells of the anterior horns, which latter directly control muscular movements. The descending comma tract is a small tract of fibres in the dorsal region situated about the middle of the column of Burdach. By some investigators it is believed to represent descending branches from posterior root fibres, by others, descending axons of cells situated in the cord. The descending cerebellar tract, or tract of Loewenthal, consists of descending axons of neurons whose cells are situated in the cerebellum. These axons end in the gray matter of the cord. The column of Goll and the column of Burdach are composed of the axons of the cells of the ganglia of the posterior roots of the spinal nerves. Entering the posterior columns, they divide into ascending and descending arms. The latter is short and soon ends in the gray matter. The ascending arm may be short, of medium length, or long. The short and medium-length fibres end in the gray matter of the

cord, after sending in collaterals at different levels. The long fibres pass up to the medulla and end, those of the column of Goll in the nucleus gracilis, those of the column of Bur-

dach in the nucleus cuneatus. The column of Lissauer consists of the shortest fibres which enter the posterior roots. These fibres end in the posterior horns. These neurons, whose central axons form the entering fibres of the posterior roots of the spinal nerves taken in connection with the analogous sensory roots of the cranial nerves, constitute the peripheral sensory neuron system. It is by means of these neurons that all impulses are conveyed from the surface of the body to the cord and brain. By their influence over the motor cells of the cord they determine the direct reflex actions. By their influence over other cells situated in the cord, medulla, and midbrain, sensory impressions are transmitted through other systems of neurons to the brain, and thus enter into consciousness. By their influence upon motor cells of the cortex they complete the cycle of a sensory impression entering consciousness and being transformed into a voluntary motion. The

direct cerebellar tract, or dorsolateral ascending tract, lies near the lateral surface of the cord from the posterior horn to about the mid-lateral point. It begins in the upper lumbar region and extends to the cerebellum. Its fibres are axons of the cells of Clark's column or the nucleus dorsalis of the same side. This nucleus is a group of cells lying in the gray matter just to the median side of the base of the

posterior horn. It extends as a continuous column from the mid-lumbar to the lower cervical region. In the medulla the direct cerebellar tract enters the restiform body and thus reaches the cerebellum by means of the inferior cerebellar peduncle. Gowers's tract, or the ventrolateral ascending tract, lies along the periphery of the cord from the anterior limit of the direct cerebellar tract to the anterior nerve roots. The tract first appears in the upper lumbar cord, and increases in size as it passes upward. Its fibres are axons of cells scattered through the gray matter of the same and opposite sides of the cord. Many of the fibres of this tract are probably spinal association fibres and reenter the gray matter to terminate there. Other fibres, however, pass upward to higher centres, their exact terminations being as yet undetermined. The remainder of the white matter of the cord is constituted by the short fibre systems (fundamental columns or ground bundles). It will be seen that in the main these short fibres lie adjacent to the gray matter and are more extensive in the anterior part of the cord.

SCHEME OF THE STRUCTURE OF THE SPINAL CORD

a, fasciculus cerebrospinalis ventralis, *b*, fasciculus ventralis proprius, *c*, fasciculus ventrolateralis Gowers, *d*, fasciculus cerebrospinalis lateralis, *e*, fasciculus lateralis proprius, *f*, funiculus dorsalis, *g*, funiculus dorsalis, *Rad dor*, radix dorsalis, *Rad vent*, radix ventralis, *Gang spn*, ganglion spinale, 1, commissural cell, or heteromeric neurons, one is seen sending its axon into the gray substance of the other side, the others send their axons into the white matter of the opposite side, 2, motor cells, sides of fibrils are seen arising from their axons, 3, tautomeric neurons, the axons going to the ventral and lateral funiculi, among these are cells in the nucleus dorsalis and some of the cells in the substantia gelatinosa Rolandi, collaterals are coming off from the axons, 4, a Golgi cell, or dendraxon, 5, cells sending their axons to the dorsal funiculi, 6, cell bodies of peripheral sensory neurons situated in the ganglion spinale, their central prolongations are shown entering the spinal cord as dorsal root fibres which bifurcating send collaterals to terminate in different parts of the substantia grisea, 7, collaterals and terminals representing fibres from the fasciculi cerebrospinales or pyramidal tract, 8, collaterals from the white fibres in the ventral and lateral funiculi.

They are axons of cells situated in the gray matter of the cord. These axons enter the white matter, pass up or down, or, splitting, send one branch up, the other down, and finally terminate in the gray matter. Along their course they send collaterals into the gray matter. These fibres of the fundamental columns thus serve to connect the gray matter of different levels of the cord, and may be considered of the nature of longitudinal commissural fibre systems. By means of these neurons an impulse coming into the cord by the posterior nerve root may be conveyed to many motor or sensory cells within the gray matter. In this way are accomplished the more complex reflex actions.

Nerve Cells of the Cord. In describing the origin of fibre systems of the cord, many of the

cells of the cord have been necessarily referred to, e.g., those cells the axons of which form the columns of Gowers and of Flechsig, and the fundamental columns. There are also found in the gray matter cells which have short axons which never leave the gray matter, but terminate in the vicinity of their cells of origin. The most important groups of cells remaining to be described are those of the anterior horns connected with the motor spinal nerve roots. These are large multipolar cells rich in chromatic substance. They are arranged in columns, two long columns extending the entire length of the cord for the innervation of the muscles of the trunk, while in the cervical and lumbar enlargements extra columns are added for the supply of the muscles of the extremities.

The Spinal Nerves. These are the peripheral nerves connected with the spinal cord. There are 31 pairs of spinal nerves, which are named from the levels of the cord from which they originate: 8 cervical, 12 dorsal, 5 lumbar, 5 sacral, and 1 coccygeal. Each spinal nerve is connected with the cord by two roots, as anterior or motor root and a posterior or sensory root. The anterior root consists of axons of the motor cells of the anterior horns. These pass out in small bundles, by the ganglion of the posterior root, beyond which they join the fibres from the ganglion to form the mixed nerve. The fibres of the sensory root have been already described in connection with the posterior columns. These are the central processes of the spinal ganglion cells. Their peripheral processes pass out of the outer end of the ganglion and join the motor fibres. The nerves leave the spinal canal through the intervertebral foramina, beyond which each nerve divides into two branches, a posterior and an anterior.

The posterior divisions of the spinal nerves are smaller than the anterior, and are distributed to the muscles and skin of the back.

The anterior divisions of the spinal nerves supply the anterior parts of the body and the

The *cervical plexus* is formed by the anterior divisions of the first four cervical nerves. The branches of distribution of this plexus may be divided into a superficial and a deep set, the former supplying the integument and superficial muscles of the side and front of the neck and upper part of the throat, the latter supplying the deeper muscles of the neck and sending one important branch, the phrenic, to the diaphragm.

The *brachial plexus* is formed by the anterior divisions of the last four cervical and the first

PLAN OF THE BRACHIAL PLEXUS.

dorsal nerves. These five nerves unite to form three main cords known respectively as the outer, the inner, and the posterior cords of the brachial plexus. Before uniting to form these cords, four main branches or sets of branches are given off. These are (1) a communicating branch to the phrenic, (2) muscular branches to the longus colli, scaleni, rhomboidei, and subclavius, (3) posterior thoracic nerve, to the serratus magnus; (4) the suprascapular, sending branches to supply the supra and infra spinatus. From the three main cords of the plexus branches are given off to the chest, shoulders, and arms. Those to the chest are the external and internal anterior thoracic, which supply the pectoralis major and pectoralis minor muscles. The branches to the shoulder are the subscapular and the circumflex, the former supplying the subscapularis, the latissimus dorsi, and the teres major; the latter supplying the deltoid and the teres minor. The circumflex nerve also supplies part of the integument of the shoulder and sends filaments to the musculocutaneous nerve. This nerve in the arm supplies the biceps, coracobrachialis, and part of the brachialis anticus muscles. In the forearm it becomes cutaneous, supplying the integument on the radial side. The internal cutaneous is a small nerve supplying the integument of the front of the arm and forearm. The lesser internal cutaneous, or nerve of Wrisberg, the smallest branch of the plexus, supplies the integument on the inner side of the arm. The musculospiral supplies the triceps, anconeus, supinator longus, extensor carpi radialis longior, and part of the brachialis anticus. It sends a cutaneous branch to the skin of the outer part of the forearm. It then divides into radial

PLAN OF CERVICAL PLEXUS.

extremities. Each anterior branch is connected by some slender filaments with the sympathetic. In the dorsal region the anterior divisions are separate and distributed quite evenly, but in the cervical, lumbar, and sacral regions they unite to form intricate plexuses.

and posterior interosseous branches, the former passing to the skin of the radial side of the hand, including thumb, index, middle and radial side of ring fingers, the latter supplying the carpal articulations and muscles of the back of the forearm. The ulnar nerve supplies the flexor carpi ulnaris and inner part of the flexor profundus digitorum. In the hand it supplies the adductor and part of the short flexor of the thumb, the interossei, the two inner lumbricales, and the muscles of the ball of the little finger. It gives off a cutaneous branch to the back of the little and ulnar side of the ring fingers and to the front of the same fingers. It also furnishes articular branches to the elbow and wrist joints. The median nerve supplies all the flexors and pronators of the forearm except those supplied by the ulnar. In the hand it supplies the two outer lumbrical muscles, part of the short flexor of the thumb, the opponens and the abductor. It also innervates the skin of the palm and of the palmar surfaces of the fingers not supplied by the ulnar.

The *lumbar plexus* lies at the back of the abdominal cavity behind the peritoneum. It is formed by the anterior divisions of the four upper lumbar nerves. Communicating branches connect the plexus with the lumbar ganglia of the sympathetic. Some muscular branches pass directly from the plexus to the quadratus lumborum and psoas muscles. Cutaneous branches are the (1) iliohypogastric, which sends an iliac branch to the skin of the buttock and a hypogastric branch to the skin of the lower abdomen, (2) the ilioinguinal, to the skin of the groin, (3) the external cutaneous,

PLAN OF LUMBAR PLEXUS.

three cutaneous branches, the internal cutaneous to the skin of the inner aspect of the thigh, a middle cutaneous to the skin of the front of the thigh, and the long saphenous to the skin of the inner side of the knee, leg, and foot; (3) the obturator, which supplies the obturator externus, the adductor longus, gracilis, and adductor magnus. Branches of this nerve sometimes pass to the adductor brevis and pectinæus. It forms the main nerve supply of the hip and knee joints, and sometimes sends a cutaneous branch to the skin of the lower and inner part of the thigh. There is sometimes an accessory obturator nerve to the pectinæus and hip joint. It is usually connected with the obturator

The *lumbosacral cord* is formed by the union of the fifth lumbar nerve with a branch from the fourth lumbar. It gives rise to a communicat-

ing branch to the fifth lumbar ganglion of the sympathetic, and a muscular branch, the superior gluteal, to the gluteus medius and minimus and the tensor fasciæ femoris, after which the cord joins the sacral plexus.

The *sacral plexus* is formed by the union of the lumbosacral cord with the first, second, third, and part of the fourth sacral nerves. It is a large plexus situated in the cavity of the

THE SACRAL PLEXUS OF THE RIGHT SIDE FROM BEHIND.

L. sac. c., lumbosacral cord, Sup. glut., superior gluteal, Inf. glut., inferior gluteal, Per., perforating, Sm. scia., small sciatic, Popl., popliteal, Pyr., nerves to pyriformis, Per. cut., perforating cutaneous, Obt. int., obturator internus, Qu. fem., quadratus femoris, Pu., pubic.

pelvis Like the other plexuses, it gives rise to communicating muscular and mixed branches. The communicating branches pass to the upper sacral sympathetic ganglia. The muscular branches supply the quadratus femoris, the obturator internus, the gemelli, the pyriformis, and a part of the gluteus maximus. The mixed nerves are (1) The small sciatic, which supplies part of the gluteus maximus and the skin of the back part of the thigh, buttock, popliteal space, and part of the leg. By means of the long pudendal branch it also supplies the skin of the perineum. (2) The pudic supplies the muscles and skin of the external generative organs. (3) The great sciatic. This nerve is the largest nerve of the body. It passes down the back of the thigh, giving off branches to the adductor magnus and the hamstring muscles. Above the popliteal space the nerve divides into the internal and the external popliteal branches. The internal popliteal sends a branch to the knee joint and supplies the popliteus muscle and the muscles of the calf of the leg. It furnishes a branch called the communicans tibialis, which joins the communicans peronei to form the external saphenous nerve, which supplies the outer side of the foot. Below, the internal popliteal is continued into the posterior tibial, which supplies the long flexor of the toes, the tibialis posticus, and the skin of the heel. In the foot it divides into the internal and the external plantar nerves. The former supplies the skin of the sole of the foot and the great, second, third, and inner side of the fourth toes, the flexor brevis pollicis, the flexor brevis digitorum, the abductor pollicis, and the two inner lumbrical muscles, the latter supplies the skin of the little and outer side of the fourth toes and the muscles of the sole of the foot not supplied by the internal plantar. The external

popliteal sends branches to the knee joint, gives off the communicans peroneus to the skin of the outer side of the back of the leg, supplies the peronei longus and brevis, and divides into the external cutaneous and anterior tibial nerves. The former supplies the skin of the upper surface of the foot and of all the toes except the outer side of the little toe and adjacent sides of the great and second toes. The anterior tibial supplies the extensors of the toes, the tibialis anticus, and peroneus tertius, and ends as a cutaneous branch to the skin of the adjacent sides of the great and second toes.

The *sacrococcygeal plexus* is a small plexus formed by the fourth and fifth sacral and the coccygeal nerves. It sends communicating branches to the sacral and coccygeal ganglia of the sympathetic, cutaneous branches to the skin of the arms and coccygeal region, muscular branches to the external anal sphincter, the levator ani, and coccygeal muscles, and branches to the pelvic plexus of the sympathetic, whence they supply the rectum and bladder.

Peripheral Terminations of Spinal Nerves. The modes of terminations of these processes are extremely varied and complicated. The terminations are always free in the sense that, while possibly sometimes penetrating cells, they are never directly continuous with their protoplasm. The motor nerve fibres end in voluntary and involuntary muscle. On its way to a muscle a motor fibre, which, as noted before, is the axon of an anterior horn cell, may divide into several branches, a single cell thus innervating more than one muscle fibre. On reaching a voluntary muscle the bundle of nerve fibres breaks up to form a plexus in the connective tissue which surrounds the bundles of muscle fibres. From this plexus nerve fibres pass to the individual muscle fibres. Having arrived at the muscle fibre in which it terminates, the nerve loses its medullary sheath, and its neurilemma fuses with the sarcolemma. The naked axon then penetrates the sarcolemma and terminates in a more or less elaborate expansion known as a motor end plate.

The sensory or afferent part of the spinal nerves is made by the peripheral processes of the spinal ganglion cells. In the skin and in those mucous membranes which are covered with squamous epithelium, the nerve fibres lose their medullary sheaths in the subepithelial tissue and, penetrating the epithelial layer, split up into minute fibrils which pass in between the cells and terminate there, often in little knob-like swellings. In addition to such comparatively simple nerve endings, there are also found in the skin and mucous membranes, especially where sensation is most acute, much more elaborate terminations. Among these may be mentioned Merkel's *tastzellen*, or touch cells, the tactile corpuscles of Meissner, and the Pacinian bodies. In tendons and in muscle, sensory nerve fibres, after losing their medullary sheaths, divide into minute fibrils which are often studded with irregular expansions. In gland tissue nerve fibres usually end as fine fibrils, which pass to the epithelial cells.

Physiology of the Spinal Cord and Spinal Nerves. The sensory nerve endings serve as the receptive apparatus by means of which external stimuli may induce a nervous impulse. The motor nerve endings serve as organs of distribution through which an impulse may so affect a muscle as to cause a contraction and consequent

muscular action. The nerves themselves apparently serve merely as a conductive apparatus for transmitting the sensory impulses from the periphery to the spinal cord and the motor impulses from the cord to the muscles. The spinal cord must be considered as subserving several quite different though related physiological purposes, of which the following are the most important: 1 Its gray matter acts as a reflex centre, i.e., a centre in which an impulse brought to it by the fibres of the posterior nerve root (usually a sensory impulse) can determine an impulse passing out in the fibres of an anterior nerve root (usually a motor impulse). In this way a motion is produced by an external stimulus without any involvement of consciousness. A simple reflex is one in which the impulse passes directly from the posterior root fibres to the cells of the anterior horns. A compound reflex is one in which the impulse in passing from the posterior root fibre to the anterior horn cell passes through another neuron situated within the cord. 2 An automatic centre. By an automatic action is meant one which apparently occurs without any determining external stimulus, e.g., the rhythmical action of the heart or the contraction and expansion of the arteries. 3 A relay station in the transmission of impulses from and to the higher centres. This takes place through the fibre tracts of the cord, and has been already referred to in connection with the description of those tracts. 4 A conduction path. This also has been noted in connection with the description of the fibre tracts of the cord.

THE BRAIN

By this term is usually meant all that portion of the cerebrospinal axis contained in the cranial cavity.

The human brain is larger and heavier relatively to the size and weight of the body than the brain of any other animal, with the possible exception of some of the smallest birds and mammals. It is larger and heavier absolutely than that of any other animal except the elephant and larger whales. It is largest in the white races, smallest in some of the Central African savages. It is larger in the male than in the female. The average weight of the adult male brain of the white races of Europe and America has been estimated at from 49 to 50 ounces, of the female at from 43 to 45 ounces. The brain is much larger relatively to the size of the body in the infant than in the adult, the brain of the newborn child weighing on an average from 10 to 12 ounces. The brain increases in weight up to middle life. After 60 it usually decreases somewhat in weight. It is a common idea that large brains are apt to be associated with unusual intellectual development. Such is not, however, the case. While the brains of some men of great intellectual attainments have proved to be above the average in weight—Cuvier, 64 ounces, Abercrombie, 63 ounces, Goodsir, 57 ounces—the brains of other men apparently equally intellectual have not been above the average in weight, and Thurman reports a case of a male epileptic whose brain weighed 62 ounces, and Bicknill one from a similar case which weighed 64½ ounces. Brains weighing over 60 ounces have also been observed in the insane.

The brain may be subdivided into the medulla

oblongata, the pons Varolii, the midbrain, the cerebellum, the basal ganglia, and the cerebral hemispheres.

The medulla oblongata is the continuation upward of the spinal cord and extends from the lower limit of the pyramidal decussation below to the lower margin of the pons above. The

length of the medulla is about an inch, and its diameters, which at its lower portion correspond to those of the cord, increase from below upward. Externally the medulla shows the continuation upward of the anterior and of the posterior fissures of the cord. These fissures become more shallow as they ascend, the posterior fissure disappearing at about the middle

MEDULLA OBLONGATA AND PONS VAROLII

Pon. Var., pons Varolii, *Mid. ped. cer.*, middle peduncle of cerebellum, *Oliv. bdy.*, olivary body, *Fiss. dec.*, pyramidal decussation, *Med. obl.*, medulla oblongata, *Ant. pyr.*, anterior pyramids

of the medulla, where the central canal opens into the fourth ventricle. On either side of the anterior fissure is a prominence caused by the anterior pyramid, and to the outer side of the pyramid the bulging of the olivary body may be seen. The anterolateral surface of the medulla is also marked by the exit of the sixth to the twelfth (inclusive) cranial nerves. The posterior surface shows two prominences on either side—one next the posterior fissure known as the clava, caused by the nucleus gracilis, or nucleus of the column of Goll, the other just to the outer side of the clava, due to the nucleus cuneatus, or nucleus of the column of Burdach. The internal structure of the me-

diulla shows considerable resemblance to that of the cord. This is especially true of the lower part of the medulla, the structures of which are directly continuous with those of the cord. The fibre tracts of the cord, however, assume, in the medulla, new directions, and in doing so break up the formation of the gray matter. This, together with the appearance of some new masses of gray matter and some new fibre bundles, is the main factor in determining the difference in structure between cord and medulla. The internal structure of the medulla can be best understood by tracing into it the structures of the spinal cord. At the junction of medulla and cord occurs the pyramidal decussation. Above this decussation the fibres of the main corticospinal motor tracts lie in two large bundles, one on either side of the anterior median fissure, known as the anterior pyramids. In the decussation of the pyramids the majority of these fibres cross over to the opposite posterolateral region and pass down into the cord as the crossed pyramidal tract, the few fibres remaining next the anterior fissure forming the direct pyramidal tract. The crossing fibres of the decussation separate off the anterior horns from the rest of the gray matter, while the intermingling of white matter and gray matter is known as the formatio reticularis. Shortly above the pyramidal decussation masses of gray matter begin to appear in the posterior columns. These are known respectively as the nucleus gracilis, or nucleus of the column of Goll, and the nucleus cuneatus, or nucleus of the column of Burdach. In these nuclei terminate most or all of the fibres of the columns of Goll and of Burdach. The nuclei increase in size *pari passu* with the decrease in the size of the columns, the latter finally entirely disappearing. These nuclei are therefore nuclei of termination for the fibres of these columns, and are of the nature of a relay station in the main spinocortical sensory conduction path. From cells in these nuclei axons pass around the central canal—internal arcuate fibres—decussate in the median line—sensory decussation—and then turn upward as the fillet or lemniscus. This is the main continuation brainward of the great sensory tract. Some axons from cells in the nuclei do not turn upward in the fillet, but, skirting the ventral surface of the pyramids, as the external arcuate fibres, pass to the cerebellum in the restiform body. Of the lateral tracts of the cord, the direct cerebellar tract joins the restiform body and thus reaches the cerebellum through its inferior peduncle, while the tract of Gowers continues upward in the lateral region of the medulla. The posterior horns become, in the medulla, separated from the rest of the gray matter and, becoming broken up, serve as nuclei of termination for the sensory divisions of some of the cranial nerves. As it passes up through the medulla, the central canal, surrounded by an increased amount of gelatinous substance, gradually approaches the posterior surface, to open at about the middle of the medulla into the fourth ventricle. Of the new masses of gray matter which appear in the medulla, the largest are the olivary nuclei. These are irregular convoluted masses of gray matter situated in the ventral part of the medulla behind and to the outer side of the pyramids. They extend from the upper limit of the sensory decussation to the pons. Each olivary nucleus has a central core of white fibres which cross the median line and pass to the opposite restiform body, forming the cerebello-olivary tract. To the inner side of the lower part of the olivary nucleus is a smaller mass of gray matter known as the accessory

dulla shows considerable resemblance to that of the cord. This is especially true of the lower part of the medulla, the structures of which are directly continuous with those of the cord. The

olivary nucleus, while above the main mass of the olive is the superior olivary nucleus. The distinct line of decussating fibres which extends through the centre of medulla and pons is called the median raphe. The nuclei of certain of the cranial nerves form masses of gray matter in the medulla. These, together with the root fibres of the nerves, will be found described below in connection with the cranial nerves.

The pons Varolii, or bridge, lies just above the medulla. Superficially its ventral surface is composed of fibres which pass transversely, forming a sort of bridge between the two cerebellar hemispheres. Internally the pons is composed of tracts of fibres (white matter) and of nuclei (masses of gray matter). The fibre tracts pass both longitudinally and transversely. The longitudinal fibres are mainly the continuation upward of tracts already mentioned in the description of the medulla, the pyramidal tract or main motor tract and the fillet or main sensory tract. Some of the longitudinal fibres are, however, fibres connecting the nuclei pontis with higher centres and commissural fibres between the nuclei pontis. The transverse fibres of the pons mostly connect the cerebellum with the nuclei pontis, and are consequently often called the middle cerebellar peduncles. They are composed of two sets of fibres which decussate in the median line, forming a median raphe continuous with that of the medulla. Fibres of the roots of the fifth and some of the higher fibres of the roots of the sixth and seventh nerves pass from their nuclei of origin to the ventrolateral surface of the pons. The gray matter of the pons consists of the nuclei of the nerves just mentioned and of nuclei scattered throughout the pons, which are known as the nuclei pontis and are connected with the middle cerebellar peduncles and with the cerebrum. Near the posterior surface of the pons is the fourth ventricle, in the floor of which is a group of deeply pigmented nerve cells called the locus ceruleus.

Above the pons is the midbrain. Here the long fibre tracts are collected into two main bundles known as the cerebral peduncles or crura cerebri. Each peduncle, or crus, consists of a ventral portion or crusta, a dorsal portion or tegmentum, and, between these, a mass of gray matter, the substantia nigra. The dorsal part of the cerebral peduncle, or tegmentum, represents the continuation brainward of the main sensory tract to the cortex cerebri. Of the ventral part of the peduncles, or crustæ, about the middle three-fifths are taken up by the fibres of the pyramidal system (including fibres to the motor nuclei of the cranial nerves). Medial to these are the fibres which pass from the frontal lobe to the nuclei pontis, while external to the pyramidal fibres are the fibres connecting the temporal lobe with the nuclei pontis. As the peduncles approach the basal ganglia, the substantia nigra disappears and the tegmentum lies just dorsal to the crusta. These bundles of fibres pass through the basal ganglia between the nucleus caudatus and the optic thalamus on the mesial side and the nucleus lenticularis on the lateral side. Here they form the internal capsule, which is directly continuous above with the corona radiata, through which the fibres enter the cortex cerebri. A bend divides the capsule into an anterior and a posterior portion. The anterior portion lies between the caudate nucleus internally and the lenticular nucleus

externally. This part of the capsule consists mainly of fibres which connect the cortex cerebri and the optic thalamus. The posterior portion of the internal capsule lies between the lenticular nucleus on its outer side and the optic thalamus on its inner side. About the anterior two-thirds of this portion is occupied by the fibres of the pyramidal tracts (including descending fibres to the motor cranial nerve nuclei). The corticopontal fibres connecting the cortex cerebri with the nuclei pontis pass through the internal capsule in two separate bundles: one bundle, coming from the frontal lobe, passes down in front of the main motor tract, the other bundle, coming from the temporal lobe, passes through the posterior portion of the internal capsule just behind the pyramidal tract. Through the posterior part of the internal capsule also passes the continuation upward of the tegmentum or main sensory tract to the cortex. On the posterior surface of the midbrain are the corpora quadrigemina or optic lobes. In the midbrain the fourth ventricle becomes narrowed and is known as the iter or aqueduct of Sylvius.

The *cerebellum*, or little brain, is that part which lies in the inferior occipital fossa. It is situated beneath the occipital lobes of the cerebrum, from which it is separated by the tentorium cerebelli. The average weight of the cerebellum is about $5\frac{1}{2}$ ounces. Its size relative to that of the cerebrum is about 1 to 8. In the infant the cerebellum is relatively much smaller than in the adult, its weight being about one-twentieth that of the cerebrum. The cerebellum measures from $3\frac{1}{2}$ to 4 inches in transverse diameter and about 2 inches from front to back at its centre. It consists of two lateral lobes and a smaller central lobe called the vermis. The cerebellum is connected with other parts of the nervous system by means of bundles of fibres known as peduncles. The superior peduncles connect it with the cerebrum, the inferior with the spinal cord. The middle peduncles connect it with the pons. The hemispheres of the cerebellum are separated in front by a fossa which encircles the corpora quadrigemina. Posteriorly the furrow is deeper and

VERTICAL SECTION OF THE CEREBELLUM.

Arb. vit., arbor vitae; *Oliv. body*, olivary body; *Nucl. dent.*, nucleus dentatus.

narrower. On the superior surface of the cerebellum, between the anterior and posterior furrows, the central lobe has a very slight elevation and is called the superior vermis. On the inferior surface of the cerebellum the central lobe, called the inferior vermis, lies at the bottom of the furrow, where it forms a distinct projection and is subdivided into an anterior portion, the nodule, a middle portion, the uvula, and a posterior portion, the pyramid. Two small lobes

stand out distinctly from the main bulk of the hemisphere—one, the flocculus, lying to the outer side of the nodule; the other, the tonsil, lying to the outer side of the uvula. Each hemisphere is divided transversely by a deep fissure called the great horizontal fissure, which separates it

into an upper or tentorial surface and a lower or occipital surface. In addition to the flocculus and tonsil, the surface of the cerebellum is divided into several less distinct lobes. On the upper surface are the quadrangular lobe and the superior semilunar lobe; on the undersurface lie the biventral lobe, the slender lobe, and the inferior semilunar lobe. Besides the deeper furrows separating the lobes, the entire surface of the cerebellum is crossed by a multitude of transverse grooves which divide it into plates or lamellæ and give it a foliated or laminated appearance. On cutting into the cerebellum it is seen to consist of a core of white matter which branches out into the cortex, composed of a layer of gray matter, presenting the characteristic leaflike appearance known as the arbor vitæ. The white matter of the cerebellum is composed of medullated nerve fibres which are axons coming from cells situated in the cerebellum and passing out to terminate either in the cerebellum itself or in some other part of the nervous system, or coming from cells located in other parts of the nervous system to their terminations in the cerebellum. The gray matter is composed of three layers—an external or molecular, an internal or granular, and, between these, a layer of large cells, named after Purkinje. The molecular layer contains multipolar cells of various sizes, known as basket cells from the fact that, while their dendrites pass mostly towards the surface, their axons pass downward and end in a basket-like network around the cells of Purkinje. The granular or nuclear layer derives its name from the fact that after staining by the ordinary methods it appears to be composed of a mass of small closely packed cells, each cell consisting of a nucleus surrounded by an extremely small amount of protoplasm. Intermingled with these cells are medullated and nonmedullated fibres. By the application of the method of Golgi these cells have been divided into small granule cells (by far the more numerous) and large granule cells. In the case

of the small granule cell the dendrites ramify in the granular layer, while the axon terminates freely in the molecular layer. The large granule cells, on the other hand, send their dendrites into the molecular layer, while their axons form a rich plexus within the granular layer. The dense network of fibres found in the granular layer is derived from the cells just described, from axons and collaterals of cells of Purkinje, and from fibres coming from the white matter.

Besides the gray matter of the cortex, certain independent masses of gray matter occur in the cerebellum. These are the nucleus dentatus, a convoluted body of gray matter situated to the inner side of the centre of the core of white matter, and the roof nuclei of Stilling, situated at the anterior end of the superior vermis and projecting forward into the roof of the ventricle. The functions of the cerebellum have been made the subject of much discussion and investigation. It is itself insensible to irritation, and has been cut away in various animals without eliciting signs of pain; moreover, its removal or disorganization by disease is generally unaccompanied with loss or disorder of sensibility, animals from whom it has been removed being apparently able to smell, see, hear, and feel as perfectly as before. Flourens extirpated the cerebellum in birds by successive layers. Feebleness and want of harmony of the movements resulted from the removal of the superficial layers. When he reached the middle layers, the animals became restless, their movements were violent and irregular. By the time that the organ was entirely removed, the animals had completely lost the power of flying, walking, standing, and preserving their equilibrium.

NERVE CELL (CELL OF PURKINJE).

From a section through the human cerebellar cortex.

When a pigeon in this state was laid upon its back, it could not recover its former position, but fluttered its wings, and saw and tried to avoid a threatened blow. Hence volition, sensation, and memory were not lost, but merely the faculty of combining the actions of the muscles. From a large series of experiments of this kind, subsequently made on all classes of animals, Flourens inferred that the cerebellum belonged neither to the sensitive nor to the intellectual apparatus, that it was not the source of voluntary movements, although belonging to the motor apparatus; that it is the organ for the coordination of the voluntary movements or for the excitement of the combined and harmonious action of the muscles.

In spite of these facts, the extent to which muscular coördination is dependent upon the cerebellum cannot be considered as satisfactorily determined.

The *cerebrum*, or brain proper, constitutes in man the largest part of the cerebro-spinal axis. Lying within the cavity of the skull, its shape conforms to that of the cranial cavity. A deep fissure runs lengthwise of the brain, called the great longitudinal fissure, separating it into two equal hemispheres. At the bottom of the fissure a broad band of fibres—the corpus callosum—unites the two hemispheres. The surface of each hemisphere is marked by numerous elevations and depressions, the former known as convolutions or gyri, the latter as fissures or sulci. These convolutions serve to increase the actual surface of the brain without increasing the actual size of the organ, and the number and extent of the convolutions are in direct relation to the intellectual development, increasing throughout the ascent of the mammalian scale, and reaching their highest complexity in civilized man.

Fissures. Of the five principal fissures of the brain, two have already been mentioned—the great longitudinal fissure, separating the two hemispheres, and the great transverse fissure, separating the cerebrum from the cerebellum. Each hemisphere presents three fissures which separate it into lobes. These are: 1. The fissure of Sylvius. This begins at the base of the brain (see diagram), passes upward and backward on the external surface of the hemisphere, and

longitudinal fissure and extends downward and forward to a point somewhat above and behind the bifurcation of the Sylvian fissure. It separates the frontal lobe from the parietal lobe. 3. The parieto-occipital fissure begins about mid-

CONVOLUTIONS AND FISSURES OF THE OUTER SURFACE OF THE CEREBRAL HEMISPHERE.

way between the fissure of Rolando and the posterior extremity of the brain, sends a short branch outward, while its longer branch extends downward and forward on the inner surface of the hemisphere.

Lobes. The frontal lobe includes that part of the brain which lies in front of the fissure of Rolando and above the fissure of Sylvius. It presents the following convolutions: (a) the ascending frontal convolution, lying just in front of the fissure of Rolando and separated from the rest of the lobe by the vertical or pre-

UPPER SURFACE OF THE BRAIN, THE ARACHNOID HAVING BEEN REMOVED.

separates the frontal and parietal lobes from the temporal lobe. 2. The fissure of Rolando begins a little behind the mid-point of the great

CONVOLUTIONS AND FISSURES OF THE INNER SURFACE OF THE CEREBRAL HEMISPHERE.

central sulcus. This remaining portion of the frontal lobe is divided by two longitudinal sulci into (b) the superior frontal convolution, (c) the middle frontal convolution, and (d) the inferior frontal convolution, also known as the convolution of Broca. These convolutions extend more or less into the undersurface of the lobe, which is marked by a groove in which lies the olfactory bulb.

The parietal lobe is separated from the frontal lobe by the fissure of Rolando, from the temporal (temporosphenoidal) lobe below by the

horizontal limb of the fissure of Sylvius, from the occipital lobe by the parieto-occipital fissure. It may be subdivided into four fairly well marked convolutions: (a) the ascending parietal, lying just behind the fissure of Rolando. Behind the ascending parietal convolution is the intraparietal sulcus. The portion of the parietal lobe above the horizontal part of the sulcus is known as (b) the superior-parietal convolution, and is continuous with the ascending parietal. That part of the lobe below the horizontal arm of the sulcus is divided by a vertical sulcus into (c) an anterior part, the supramarginal convolution, and (d) a posterior part, the angular convolution.

The occipital lobe is separated from the upper part of the parietal lobe by the parieto-occipital fissure, while it is more or less continuous with the lower part of the parietal lobe and with the temporal lobe by small connecting convolutions. The lobe is rather indefinitely divided by two small transverse fissures into first, second, and third occipital convolutions.

The temporal lobe lies in the middle fossa of the skull and is bounded above and in front by the Sylvian fissure. Posteriorly, connecting convolutions unite it with the parietal and occipital lobes. It is divided by two horizontal sulci into three convolutions called

The internal surface of the cerebrum is less distinctly marked off into lobes than the external. The fissures on the internal surface are the callosomarginal, the parieto-occipital, the

calcarine, the collateral, and the dentate. The callosomarginal is the longest of these fissures, begins on the superior surface just behind the mid-point, and runs forward parallel to the curve of the surface of the brain, separating the marginal or first frontal convolution from the gyrus fornicatus, which lies just over the corpus callosum. The quadrate lobule lies between the callosomarginal sulcus and the parieto-occipital sulcus. The cuneus or occipital lobule lies between the parieto-occipital sulcus in front and above and the calcarine sulcus below. The uncinata gyrus lies below the Sylvian fissure and the dentate sulcus, while below it is separated from the temporal lobe by the collateral sulcus. The temporal lobe is continuous with that on the outer surface of the cerebrum. It presents two convolutions in addition to those already described on its outer surface.

The undersurface of the cerebrum shows some important features, which, passing from before backward, are as follows: (1) The longitudinal fissure, separating the frontal lobes. (2) The corpus callosum, appearing in the depth of the longitudinal fissure and serving as a great transverse commissure connecting the two hemispheres. (3) The olfactory nerve with its expanded extremity the olfactory bulb, lying in a groove in the undersurface of the frontal lobe. (4) The fissure of Sylvius, separating the anterior from the middle lobe. (5) The anterior perforated space—so called from the perforations for the passage of blood vessels—is the undersurface of the corpus striatum (See below.) (6) The pituitary body, or hypophysis cerebri. (7) The infundibulum is a narrow tube of gray matter connecting the pituitary body with (8) the tuber cinereum, an eminence of gray matter lying between the diverging cere-

duncles, or crura cerebri, are two diverging bundles of white fibres which appear to come out from behind the anterior border of the pons. (13) The undersurface of the cerebrum also shows the exit of the third and fourth cranial nerves.

Ventricles of the Brain. The lateral ventricles represent the expanded anterior end of the embryonic neural canal, and are the cavities of the hemispheres. They are lined by a single layer of simple cylindrical epithelium, the ependyma, derived from the epiblastic lining of the neural canal. The two ventricles are separated from each other in the median line by a vertical septum known as the septum pellucidum. The shape of the ventricles is irregular, each ventricle consisting of a main cavity or body and

extending off from this three smaller cavities called cornua or horns. The anterior horn passes outward and forward into the anterior lobe. The posterior horn extends backward into the posterior lobe, while the middle horn descends into the substance of the middle lobe. The main cavity of the ventricle is roofed in by the undersurface of the corpus callosum. Its floor is made by the corpus striatum and optic thalamus, although the stria terminalis, choroid plexus, corpus fimbriatum, and fornix are also situated in its floor. The third ventricle is a long narrow cavity lying between the optic thalami. Above it is bounded by the undersurface of the velum interpositum, to which is attached the choroid plexus of this ventricle. Its floor is made by the lamina cinerea, tuber cinereum, infundibulum, corpora albicantia, and posterior perforated space. Three commissures cross the cavity of the ventricle, known respectively as the anterior, the middle, and the posterior commissures. Four openings connect the third ventricle with other cavities. In front the foramina of Monro, one on each side, serve to connect the third ventricle with the lateral ventricles. Posteriorly, the aqueduct of Sylvius connects the third ventricle with the fourth. A fourth opening in the anterior part of the floor leads into the cavity of the infundibulum. The so-called fifth ventricle of the brain is, properly speaking, not a true ventricle, being simply a part of the great longitudinal fissure which has been cut off in the development of the brain, by the union of the two hemispheres, through the corpus callosum and the fornix. It is not lined by epithelium as are the other ventricles. The fourth ventricle is described in connection with the medulla oblongata.

Certain structures remain to be described which have already been mentioned as lying in the floor of the lateral ventricles. The two largest of these, often called the basal ganglia, are the corpora striata and the optic thalami.

The corpora striata are two masses of mingled gray matter and white matter, the superior surfaces of which appear in front of the body of the lateral ventricles. The extraventricular portion is known as the lentiform nucleus. The intraventricular part, known as the caudate nucleus, is smaller than the extraventricular, from which it is separated by the internal capsule, a large band of fibres which represents the continuation upward of the main tracts of the cord and crura on their way to the cerebrum. A layer of white matter which covers the extraventricular portion of the lentiform nucleus is known as the external capsule.

The optic thalamus lies to the inner side and behind the lentiform nucleus, from which it is separated by a part of the internal capsule. Each thalamus is composed of white matter externally, of gray matter internally, and rests upon the corresponding crus cerebri. In front is a prominence known as the anterior tubercle, while its posterior part presents two small rounded eminences, the internal and the external geniculate bodies.

The stria terminalis is a narrow band of white fibres which lies in the depression between the caudate nucleus and the optic thalamus. Anteriorly, it follows the descending pillar of the fornix; posteriorly, it passes into the descending horn of the ventricle, and at the bottom of the horn enters a mass of gray matter known as the nucleus amygdalæ.

The velum interpositum is a vascular extension of the pia mater into the interior of the brain through the great transverse fissure. It enters the third ventricle beneath the corpus callosum and above the optic thalami, corpora

they pass into the optic thalami. The posterior pillars of the fornix pass downward in the descending horns of the lateral ventricle, their thin margin forming the already described corpora fimbriata.

The hippocampus major, or cornu Ammonis, so called from its fancied resemblance to a ram's horn, is a long curved body consisting of both gray matter and white matter which follows the curve of the floor of the middle horn of the lateral ventricle. It is formed by an extension inward of the dentate sulcus. The gray substance of the sulcus forms an irregular ridge along the margin of the hippocampus major, known as the fascia dentata. The lower end of the hippocampus major is marked by several rounded elevations which from their resemblance to the paw of an animal are known as the pes hippocampi. The hippocampus minor is a longitudinal eminence in the floor of the posterior horn of the lateral ventricle. It is due to the extension inward of the calcarine sulcus. The eminentia collateralis, or pes accessorius, is an eminence caused by the inward projection of the collateral fissure. It lies between the hippocampus major and hippocampus minor and between the posterior and descending horns of the lateral ventricle.

General Histology of the Cerebrum. Each cerebral convolution consists of a central white core covered by a layer of gray matter, which latter constitutes the cerebral cortex. The cerebral cortex may be divided into three fairly marked and distinct layers (1) an outer barren or molecular layer, (2) a middle layer of pyramidal cells, (3) an inner layer of polymorphous cells.

1 The nerve cells of the barren or molecular layer are known as the cells of Cajal. They are fusiform, triangular, or irregular in shape, and both their dendrites and axons ramify in this outer layer, the axons passing mainly in a direction parallel to the surface. This layer also contains the terminations of the apical dendrites of the pyramidal cells, some medullated nerve fibres running parallel to the surface, called superficial tangential fibres, and a rich plexus of neuroglia.

2 The layer of pyramidal cells is often described as two separate layers, an outer layer of small pyramidal cells and a deeper layer of large pyramidal cells. Each pyramidal cell projects from its outward angle a large apical or main dendrite. Smaller dendrites pass off from the sides and base of the cell. The axon originates from the base of the cell and enters the white matter of the corona radiata. During its passage through the gray matter it sends off collateral branches, some of which are medullated and form the deep tangential fibres. Among the deeper cells of this layer are found some very large pyramidal cells, called the cells of Betz. These are found only in the motor cortex, and it is believed that their axons pass down through the internal capsule to the cord as the main motor tract. In this layer are also found cells—cells of Martinotti—the dendrites of which

DIAGRAM OF THE CELLS OF THE CEREBRAL CORTX

• A, superficial or molecular layer (1) fusiform, (2) triangular, (3) polygonal cells of Cajal. B, layer of small pyramidal cells (4) smallest, (5) small, (6) medium-sized pyramidal cells with their axons descending to the white matter, giving off collaterals in their course. C, layer of large pyramidal cells (7) large pyramidal cells with very numerous dendrites, (8) largest giant pyramidal cells, (9) Martinotti cell with descending dendrites and ascending axon, (10) polygonal cells. D, deep layer (11) fusiform cells, (12) polygonal cells. E, the white matter containing axons from pyramidal cells, (4), (6), (8), and cells (12) of the deep layer, (13) neuroglia fibre.

quadrigemina, and pineal body. Anteriorly, it bifurcates, a part entering each lateral ventricle through the foramen of Monro. In the third ventricle two vascular fringes hang down from the velum. These are the choroid plexuses of the third ventricle. In the lateral ventricles similar fringes are attached to the lateral margin of the velum. These are the choroid plexuses of the lateral ventricles.

The corpus fimbriatum, or fimbria hippocampi, is the lateral edge of the posterior pillar of the fornix. It is a narrow white band lying just behind the choroid plexus of the lateral ventricle.

The fornix is an arch-shaped band of white fibres, running longitudinally, which bifurcates both anteriorly and posteriorly, forming the anterior and the posterior pillars of the fornix. The central portion or body of the fornix is triangular in shape, its narrow anterior end being attached to the septum pellucidum, its broad posterior extremity being continuous with the corpus callosum. The anterior pillars curve downward in the lateral walls of the ventricle and enter the corpora albicantia, from which

PYRAMIDAL CELL FROM A PERPENDICULAR SECTION OF THE CEREBRAL CORTX OF ADULT MAN

The terminal branches of the dendrites running towards the molecular layer are not visible.

These are found only in the motor cortex, and it is believed that their axons pass down through the internal capsule to the cord as the main motor tract. In this layer are also found cells—cells of Martinotti—the dendrites of which

pass downward, while their axons pass upward to the molecular layer, where they turn and run parallel to the surface as the superficial tangential fibres. Cells of Golgi type II are also found in this layer. The axons of these cells branch rapidly and end in the gray matter in the vicinity of their cells of origin. The fibres of this layer consist of the axons and dendrites of the cells which have been described and of axons from cells in other regions which are passing to their terminations here.

3. The cells of the third layer are fusiform or irregular in shape. They have no apical dendrites, their protoplasmic processes coming off irregularly and ramifying mainly in this layer. Their axons pass down into the corona radiata. The fibres of this layer consist of axons and dendrites of the cells just described, of the axons of pyramidal cells, and of axons of cells in other parts of the nervous system which are passing to their terminations here.

The corona radiata, or central core of white matter radiating out into the gray matter, consists of: (1) Descending fibres, which are axons of the large and small pyramidal cells and of the polygonal cells of the third layer. These axons become medullated and pass (a) to other convolutions of the same hemisphere—association fibres; (b) through the corpus callosum to the opposite hemisphere—commissural fibres; (c) to the internal capsule as fibres of the descending tracts—projection fibres. (2) Ascending fibres, which are axons of cells situated elsewhere in the nervous system, and which are here passing to their terminations. These fibres are (a) axons of cells situated in other convolutions of the same hemisphere—association fibres; (b) axons of cells situated in the opposite hemisphere, which have come through the corpus callosum—commissural fibres; (c) axons which have come through the internal capsule from cells situated in lower centres—projection fibres.

Circulation. The arterial supply of the brain comes from two sources, the internal carotids and the vertebrals. At the base of the brain these four vessels form a remarkable anastomosis known as the circle of Willis. The arrangement of these vessels can be best appreciated by reference to the accompanying diagram. From this circle there pass off to the brain three main sets of branches: (1) The anterior cerebral arteries, which pass forward in the great longitudinal fissure, curve around the anterior border of the corpus callosum, and, running backward on its upper surface, terminate by anastomosing with the posterior cerebral arteries. They supply the undersurfaces of the anterior lobes, part of the internal surfaces of the hemispheres, the corpus callosum, the third ventricle, and the anterior perforated space. Near their origin from the internal carotids, the two anterior cerebrals are united by a short thick trunk, the anterior communicating. (2) The middle cerebral or Sylvian arteries, which pass outward along the Sylvian fissures, within which each divides into three branches—an anterior to the anterior lobe, a posterior to the posterior lobe, and a median to the small lobe near the end of the fissure of Sylvius. (3) The posterior cerebral arteries, which, arising from the basilar, pass backward and outward on the undersurfaces of the occipital lobes, each terminating in three branches, which pass respectively to the uncinate gyrus,

to the temporosphenoidal lobe, and to the lingual, lobule, cuneus, and occipital lobe.

All these arteries ramify in the pia, where they anastomose freely. From this anastomosis are given off small branches which enter the substance of the brain, the shorter ones break-

ing up into a capillary network in the gray matter, the longer ones passing to the white matter. After entering the brain substance, there is no further anastomosis, the arterial capillaries passing directly into venous capillaries without communicating with neighboring arteries.

Besides these cortical branches, branches from the circle of Willis supply the basal ganglia. Like those in the cortex, these arteries are terminal vessels.

The blood supply of the spinal cord is derived from three main arteries, the anterior spinal and two posterior spinal. The anterior spinal vessels arise from the vertebrals, and on the anterior surface of the medulla, unite to form a single trunk, which descends along the anterior median fissure. The posterior spinal arteries also arise from the vertebral arteries and pass down the posterior aspect of the cord along the line of the posterior nerve roots. Branches from the spinal arteries form an extensive anastomosis in the pia mater, and from this network branches pass into the substance of the cord. These arteries, like those in the brain, do not anastomose after entering the nervous tissue proper.

Functions of the Cerebrum. The brain, and more especially the cerebral hemispheres, must be considered as the organ of the mind. It is here that those material activities take place

which underlie those mental attributes which we recognize as consciousness, intellect, emotions, and will. In the case of the higher animals removal of the cerebrum results so promptly in death that few conclusions can be drawn. In one of the lower animals, e.g., the frog, the result is the destruction of all volition and apparently of all consciousness. Stimulation, such as pinching the toes or applying the electric current to nerves or muscles, causes muscular contraction and consequent movement, but if left entirely alone the frog shows no sign of movement, with the exception of the automatic movements connected with the heart beat and with breathing. Dalton's description of a pigeon from which the cerebrum had been removed is as follows: "The effect of this mutilation is simply to plunge the animal into a state of profound stupor in which it is almost entirely inattentive to surrounding objects. The bird remains sitting motionless upon his perch or standing upon the ground with eyes closed and head sunk between the shoulders. The plumage is smooth and glossy, but is uniformly expanded by a kind of erection of the feathers, so that the body appears somewhat puffed out and larger than natural. Occasionally the bird opens its eyes with a vacant stare, stretches its neck, perhaps shakes its bill once or twice, or smooths down the feathers upon its shoulders, and then relapses into its former apathetic condition." The brain would thus seem to be essential to any conscious activity. Whatever functions are carried on by the rest of the nervous system enter into consciousness only through the brain. Thus, stimulation of a sensory nerve may be conceived as causing a motion (as in the case of the frog without a cerebrum) entirely independent of the brain, but in such a case there is neither any consciousness of the stimulation (sensation) nor any knowledge or control of the resulting motion. It is a purely reflex act. By means of the brain, then, stimulation of sensory nerves results in an activity in consciousness which we call sensation, and by the same means both knowledge of and control over motion are accomplished. The so-called higher mental activities, intellect or thought and feeling or emotion, are also entirely dependent upon the cerebrum.

Our knowledge of the localization in the brain of its various functions is still far from perfect. Much of the experimentation upon cerebral localization has been done upon the monkey by exposing the brain and electrically stimulating its surface. The work of Ferrier along this line has been of extreme importance. By electrically stimulating the cortex in the monkey he determined the area stimulation of which caused motion of some part of the body, and by comparing the convolutions of the monkey's brain with those of the human brain, he determined the probably analogous areas. The results may be briefly summed up as follows: There is a considerable area having the fissure of Rolando for its central line, which is known as the general sensory-motor area. Stimulation of other parts of the brain failed to elicit any reaction. The sensory areas are not so well defined, and for obvious reasons are much more difficult of determination. Within this same region are probably located the areas which have to do with general sensations. The special senses have, however, special localizations. Thus, the cortical visual centre is situated in the occipital lobe,

the centre for the conscious appreciation of sound (hearing centre) in the front and upper part of the temporal lobe, while the sense of smell is located below the latter in the tip of the temporal lobe.

That the frontal lobes are most concerned in the higher intellectual activities has long been believed. Stimulation of these lobes causes no reaction. According to Ferrier their complete removal causes no sensory or motor disturbances. Experimental removal of the frontal lobes in monkeys has no apparent effect on the appetites, instincts, sensory or voluntary movements, but there is a very decided alteration in the animal's character and behavior. Instead of being actively interested in their surroundings, and curiously prying into all that comes within the field of their observation, they remain apathetic or dull, or doze off to sleep, responding only to sensations or impressions of the moment, or varying their listlessness with purposeless wanderings to and fro. While not actually deprived of intelligence, they have lost the faculty of attentive and intelligent observation.

The separate localization of the different emotions, such as hate, love, fear, etc., which the teachings of phrenology would lead one to expect, has never been accomplished. In fact, there is every reason to believe that no such localization exists, the same parts of the cortex being concerned in very different emotions.

The Cranial Nerves. The cranial nerves arise from the undersurface of the brain and leave the cranial cavity through foramina in its floor. According to the older classification of Willis (1664) the cranial nerves were divided into nine pairs. The later and now more generally used classification of Sömmerring (1796) recognizes 12 pairs. The names of these nerves, taken in order from the frontal to the occipital part of the brain, are, according to these classifications, as follows:

NERVES	Sömmerring	Willis
Olfactory	Pair First	Pair First
Optic	Second	Second
Oculomotor	Third	Third
Trochlear	Fourth	Fourth
Trigeminal	Fifth	Fifth
Abducens	Sixth	Sixth
Facial (Portio dura)	Seventh	} Seventh
Acoustic (Portio mollis)	Eighth	
Glossopharyngeal	Ninth	} Eighth
Vagus	Tenth	
Spinal accessory	Eleventh	} Ninth
Hypoglossal	Twelfth	

From the physiological standpoint these nerves fall into three groups, according to their functions. 1. Motor nerves (a) oculomotor, (b) trochlear, (c) abducens, (d) facial, (e) hypoglossal. 2. Sensory nerves: (a) olfactory, (b) optic, (c) acoustic. 3. Mixed nerves (a) trigeminal, (b) glossopharyngeal, (c) vagus, (d) spinal accessory. Of these the olfactory, optic, acoustic, and parts of the glossopharyngeal and trigeminal are sometimes classified by themselves as nerves of special sense.

The cranial nerves are connected with the surface of the brain at various points. These points are known as the apparent or superficial origin of the nerves. From these points their fibres can be traced into the substance of the brain to their real or deep origins in the gray matter.

The cranial nerves, with the exception of the first (olfactory) and the second (optic), are analogous, both embryologically and anatomically, to the spinal nerves.

The motor root fibres of the cranial nerves are the axons of neurons whose cell bodies are situated in the gray matter of the medulla and parts above (motor nuclei of the cranial nerves), just as the motor root fibres of the spinal nerves are the axons of neurons whose cell bodies are situated in the gray matter of the cord (anterior horns). These motor nuclei are the nuclei of origin for these nerves. They are nuclei of termination for neurons of higher systems which serve to bring the peripheral neuron under the control of higher centres.

The neurons which constitute the sensory portions of the cranial nerves have their cell bodies situated in ganglia outside the central nervous system. These ganglia correspond to the posterior root ganglia of the spinal nerves. The outwardly directed processes of these cells pass to their peripheral terminations, as do those of the spinal ganglia cells. The central axons of these neurons enter the medulla and form longitudinal tracts of fibres in a manner quite analogous to the formation of the posterior columns by the central axons of the spinal ganglia cells. The sensory root fibres of the cranial nerves, however, do not ascend, as do those of the spinal nerves, but turn spine-ward, forming descending roots. These fibres terminate in the gray matter of the medulla (terminal nuclei of the cranial nerves) in the

terminates in an enlargement, the olfactory bulb, from which the olfactory nerves themselves are given off. The size and development of this olfactory process and bulb vary greatly in different animals, being in man quite rudimentary

same manner as do the spinal sensory root fibres in the gray matter of the cord and medulla.

The first, or olfactory, nerve is properly not a nerve, but a slender process of the brain which

as compared with animals noted for their acute sense of smell. The olfactory nerves proper, i.e., the bundles of filaments extending from the undersurface of the olfactory bulb through the foramina in the cribriform plate of the ethmoid to the mucous membrane of the nose, are made up of axons of neurons whose cell bodies are located in the nasal mucous membrane. In this respect the peripheral olfactory neurons differ from all other human peripheral sensory neurons. The short, hairlike processes of these cells which pass outward towards the surface are the dendrites. The centrally directed processes are the axons. They are nonmedullated, and, passing through the cribriform plate in bundles (olfactory nerves), enter the olfactory bulb, where they terminate in end arborizations in the olfactory glomeruli. In the glomeruli they come into relation with the dendrites of the mitral cells of the olfactory lobe. The axons of these mitral cells are medullated and form the main mass of fibres which pass back to the brain through the olfactory process or tract and its roots.

The second cranial, or optic, nerve is the nerve concerned in the special sense of sight. It is distributed entirely to the eyeball. The nerves from the two eyes, passing backward and inward, unite to form the optic commissure. From the commissure two large bundles of fibres—the optic tracts—pass backward and outward to the brain. The eye differs from all other sense organs in that its nervous apparatus is developed by a direct outgrowth from the embryonic neural canal. Later the ingrowth of mesoblastic tissue separates the external or retinal part from the central nervous system. This retinal part is analogous to the

posterior root ganglion of the spinal nerves, and, as is the case with the latter, its subsequent connection with the central nervous system is made by the growth of axons from the peripherally situated cells back into the central system. For structure of retina, see EYE.

The third, or oculomotor, nerve is a purely motor nerve. Its fibres are the axons of a group of cells situated just to one side of the median line in the floor of the aqueduct of Sylvius beneath the corpora quadrigemina. Passing internally to the red nucleus, the nerve reaches the ventral surface of the midbrain at the inner margin of the cerebral peduncle in front of the pons. The nerve runs forward along the inner wall of the cavernous sinus and, dividing into two parts, enters the orbit through the sphenoidal fissure. Its superior branch supplies the superior rectus and levator palpebræ. The inferior branch supplies the internal rectus, the inferior rectus, and the inferior oblique.

The fourth, or trochlear (pathetic), is the smallest cranial nerve. Like the preceding, it is a purely motor nerve. Its fibres originate in a group of cells in the floor of the aqueduct of Sylvius, just below the nucleus of the third

smaller motor root come from cells situated in the medulla. The fibres of the sensory root come from cells in the Gasserian ganglion. The central processes of these cells enter the pons and pass to two nuclei in the floor of the fourth ventricle. The Gasserian ganglion lies in a depression in the petrous portion of the temporal bone. From the anterior aspect of the ganglion three branches are given off—the ophthalmic, the superior maxillary, and the inferior maxillary. The ophthalmic divides into three branches, the lachrymal, frontal, and nasal, which enter the orbit through the sphenoidal fissure and supply the eyeball, lachrymal gland, mucous membrane of the eye and nose, and the skin of the eyebrow, forehead, and nose. Connected with the ophthalmic branch is a small ganglion called the ophthalmic or ciliary ganglion. The superior maxillary is the middle of the branches of the Gasserian ganglion. It crosses the sphenomaxillary fossa, in which it gives off three branches, the orbital, the sphenopalatine, and the posterior dental. The nerve next enters the infraorbital canal, where it gives off the anterior dental branch. It then passes to the face through the infraorbital foramen and terminates in palpebral, nasal, and labial branches. The sphenopalatine, or Meckel's, ganglion is connected with this branch of the fifth nerve. It sends off four main sets of branches—ascending, to the orbit; descending, to the palate, posterior, to the pharynx; and internal, to the nose. The inferior maxillary is the largest branch of the Gasserian ganglion and receives the entire motor portion of the nerve. Just beneath the base of the skull the nerve divides into two branches, an anterior branch and a posterior branch. The anterior branch contains nearly all the motor fibres and, splitting up into masseteric, deep temporal, buccal, and pterygoid branches, supplies the muscles of mastication. The posterior division is mainly sensory and is distributed as three branches—the auriculo-temporal, gustatory, and inferior dental. Two small ganglia, the otic or Arnold's, and the submaxillary, are connected with this branch of the fifth nerve.

The sixth, or abducens, nerve is a small motor nerve which arises in the floor of the fourth ventricle and is distributed entirely to the lateral rectus muscle.

The seventh, or facial, is a motor nerve. It arises in a group of cells situated deep in the formatio reticularis of the upper part of the medulla. The nerve leaves the surface of the brain just behind the pons between the olive and the restiform body, thus lying to the outer side of the sixth nerve. It passes forward and enters the internal auditory meatus with the sixth nerve. At the bottom of the meatus it passes into the Fallopian aqueduct, by means of which it traverses the petrous portion of the temporal bone, finding exit through the stylo-mastoid foramen. It then enters the parotid gland, and just behind the jaw divides into two main branches, the temporofacial and cervicofacial. During its passage through the temporal bone it is connected with a small gray mass known as the geniculate ganglion. Its branches of distribution are as follows. Within the Fallopian aqueduct a tympanic branch to the stapedius muscle, and the chorda tympani to the muscle of the tongue (lingualis); at its exit from the styloid foramen, the posterior auricular branch to the *retrahens aurem* and part of

PLAN OF THE FIFTH CRANIAL NERVE

nerve. It winds around the outer side of the crus cerebri just in front of the pons and, passing along the outer wall of the cavernous sinus, enters the orbit through the sphenoidal fissure. It supplies the superior oblique muscle.

The fifth, trigeminus, or trifacial, is the largest of the cranial nerves. It resembles the spinal nerves in being composed of a motor part and a sensory part. The fibres of the

the occipito-frontalis, the stylohyoid to the muscle of that name, and the digastric to the digastric; on the face, the temporofacial, dividing into temporal branches and malar branches, and the cervicofacial, distributed to the muscles of the head and face.

The eighth, or acoustic (auditory), nerve is the nerve of hearing and is distributed to the internal ear. It is composed of two divisions, the cochlear and the vestibular. The fibres of the cochlear division are axons of bipolar cells in the ganglion of Corti. The peripheral processes of these cells end among the epithelial cells of Corti's organ within the cochlea. Their central processes enter the medulla at the junction of the medulla and pons and terminate in two nuclei known as the ventral and dorsal nuclei of the cochlear nerve. By means of neurons whose cell bodies are situated in these nuclei, auditory impressions are carried to higher centres. The neurons of the vestibular division of the nerve have their cell bodies located in Scarpa's ganglion or the ganglion vestibulare. These cells are bipolar and their peripheral processes end among the hair cells of the crista and macula acustica. Their central processes enter the medulla and pass to two nuclei of termination in which are cells whose axons carry the impulses to higher centres. See also EAR.

The ninth, or glossopharyngeal, nerve leaves the upper part of the medulla in the groove between the olive and the restiform body. It consists of a sensory part and a motor part. The nerve cells of the sensory part are situated in two small ganglia, the jugular and the petrous. The central processes of these cells enter the medulla and terminate in a nucleus in the floor of the fourth ventricle, which is common to this nerve and the tenth. The two parts of the nerve unite and leave the skull through the jugular foramen. Branches of this nerve are distributed to the tympanum, to the carotid, to the muscular coat and mucous membrane of the pharynx, to the stylopharyngeus, to the tonsil, and to the tongue.

The tenth, vagus, or pneumogastric nerve leaves the medulla just behind the ninth. It is composed of two portions, a sensory and a motor, which are connected with the already described nuclei common to both ninth and tenth nerves. The nerve leaves the cranial cavity through the jugular foramen. In the foramen it presents a swelling known as the ganglion jugulare, or ganglion of the root, while just outside the foramen is a second ganglion, the inferior ganglion, or ganglion of the trunk. It is in these two ganglia that the cell bodies of the sensory neurons of the nerve are situated. After its exit from the foramen, the nerve passes vertically down the neck within the sheath of the carotid vessels, supplying the larynx and œsophagus, heart and lungs, stomach, and most of the abdominal viscera.

The eleventh nerve, or accessory (spinal accessory), is composed of two parts, a spinal and a cerebral: The latter is the smaller and arises from a group of cells situated in the medulla below the nucleus of the vagus. It leaves the medulla as three or four small filaments and passes through the jugular foramen in a sheath common to it and the vagus, which it joins, supplying the cardio-inhibitory and visceromotor fibres of the vagus. The spinal portion of the nerve originates in a long nucleus situated in the lateral region and extending from the middle

of the medulla to the fifth or sixth cervical nerve. The fibres leave the cord in the mid-lateral region and pass through the jugular foramen, supplying the sternomastoid and trapezius muscles.

The twelfth, or hypoglossal, nerve serves as the motor nerve for the tongue, whose muscles it supplies. Its nucleus is in the floor of the fourth ventricle, ventral and lateral to the central canal. Fibres from this nucleus leave the medulla in bundles, from 10 to 15 in number, between the olive and the anterior pyramids. The nerve passes through the anterior condyloid foramen. The branches of distribution are the descendens noni, the thyrohyoid muscular branches, and meningeal branches.

The Sympathetic Nervous System. This is composed of (a) two series of ganglia which are connected with one another by nerve fibres and extend along either side of the vertebral column from the base of the skull to the coccyx; (b) plexuses, three in number, which lie in front of the spine in the thoracic, abdominal, and pelvic cavities; (c) smaller ganglia, situated in

THE SYMPATHETIC NERVE.

or upon various viscera; (d) nerve fibres which connect the ganglia with one another, with the cerebrospinal system, and with the periphery.

The series of ganglia is known as the gangliated cord and may be subdivided into 3 cervical, 12 dorsal, 4 lumbar, and 5 sacral ganglia. In the neck these ganglia lie upon the transverse processes of the vertebrae, in the thorax upon the heads of the ribs, in the abdomen and pelvis upon the bodies of the vertebrae and upon the

sacrum. As the two cords pass into the pelvis they unite in a ganglion called the ganglion impar, in front of the coccyx. Superiorly the gangliated cord is continued into the sympathetic plexus on the carotid artery, this plexus being connected by filaments with the lower cranial nerves. The ganglia are connected with one another by bundles composed of intermingled gray fibres and white fibres, the white fibres being derived from the spinal nerves. The branches which connect the sympathetic ganglia with the cerebrospinal system are composed of both white fibres (medullated) and gray fibres (nonmedullated). The former are derived from the cerebrospinal axis and pass to the sympathetic, the latter originate in the sympathetic system and end in the cerebrospinal.

The three great gangliated plexuses are known respectively as the cardiac, the solar or coeliac, and the hypogastric. They are composed of nerve fibres and ganglia, the former coming from the cerebrospinal nerves and from the gangliated cord. The cardiac plexus consists of a superficial portion which lies in the concavity beneath the arch of the aorta, and of a deep portion situated between the aorta and the trachea. The solar plexus is the great plexus of the abdomen and supplies all the abdominal viscera. It is subdivided into several smaller plexuses, the names of which sufficiently indicate their location and distribution. They are known as the aortic plexus, the gastric plexus, the phrenic (diaphragmatic) plexus, the suprarenal plexus, the renal plexus, the spermatic (ovarian, in the female) plexus, the splenic plexus, the hepatic plexus, and the superior mesenteric plexus. The hypogastric plexus lies on the front of the sacrum between the two common iliac arteries. Below, the hypogastric plexus is continued into the pelvic plexus, which is situated at the side of the rectum and bladder in the male, of the rectum, vagina, and bladder in the female. It sends branches to all the pelvic viscera and gives rise to the following subsidiary plexuses, the inferior hemorrhoidal, the prostatic, the vesical, and in the female the uterine and vaginal.

Smaller ganglia are situated in certain viscera, notably in the heart, stomach, intestines, and uterus. They are mostly microscopical in size.

All of these ganglia serve as true nerve centres, and from them pass off branches of distribution to the involuntary muscles of the blood vessels and of the gastrointestinal canal, to the thoracic and abdominal viscera, to the secreting cells of the various glands, etc.

Functionally the sympathetic system is quite distinct from the cerebrospinal system. It has been called the system of vegetative existence because of its presiding over the processes of nutrition and growth, the so-called vegetative functions, in contradistinction to the cerebrospinal system, which presides over such distinctly animal faculties as sensation, motion, and intellect. The sympathetic system controls the so-called automatic mechanisms of the body, the rhythmical beating of the heart, contraction and dilatation of the arteries, the peristaltic action of the gastrointestinal tract, the contraction of smooth muscle in general wherever found, the control of secretion of various glands, etc. It has also been customary to ascribe to the sympathetic a certain trophic function, by

which was meant the determination of the nutrition of the various tissues and organs. It seems more proper to ascribe this nutritional control to its vasomotor function, by means of which it determines the blood supply to the various parts. The sympathetic nerves contain both afferent and efferent fibres, so that impulses are transmitted both to and from the ganglionic centres. The close anatomical relation which exists between the cerebrospinal and the sympathetic system has been mentioned, and while the latter seems to be to a certain extent independent in its action, it is not infrequently brought under the control of the former even in our conscious activities. Thus, in the case of blushing an impulse reaching the cerebrospinal centres through the eye, ear, or other sense organs causes such a reaction on the part of the sympathetic as to bring about a dilation of the capillaries of the face. Again, in the case of the heart, quick beating and palpitation are frequently caused by the reaction of the sympathetic to impulses which have passed in through the cerebrospinal nerves.

NESBIT, EDITH. See BLAND, EDITH NESBIT.

NESFIELD, nêz'fêld, WILLIAM EDEN (1835-88). An English architect, born in Bath, the son of a well-known landscape architect, Maj. William Andrew Nesfield. He was educated at Eton and later apprenticed to the architect Burn and to his own uncle, who was a fanatical Gothickist. He traveled in France, Italy, and Greece and practiced in London after 1859. Nesfield designed a new wing to Combe Abbey, built Claverly Hall, Loughton Hall, and Kimmel Park, lodges for Regent's Park and Kew Gardens, a bank, hotel, and other buildings, and restored various churches. Although his *Sketches from France and Italy* (London, 1862) became almost a vade mecum for the Victorian Gothickists, he worked in both the Gothic and the Renaissance manners.

NESIOTES, nê'si-ô'têz. See HARMODIUS AND ARISTOGITON.

NESPELIM. See SALISHAN STOCK.

NESS, LOCH. A lake in the County of Inverness, Scotland. It occupies, together with Loch Lochy and Loch Linnhe, the bottom of the great fracture, a rift valley of ancient age, which

in an almost straight line severs the northwestern Highlands from the rest of Scotland and which is known as Glen More, or Great Glen (Map: Scotland, D 2). Loch Ness is 23 miles long, from $\frac{1}{2}$ to $1\frac{1}{2}$ miles broad, and connected by the Ness River with Moray Firth on the northeast and the Caledonian Canal with Loch Lochy on the southwest. It receives the waters of several small rivers and is surrounded by high and steep mountains which make the scenery very picturesque. Owing to its immense depth, the Loch never freezes.

NESSELRODE, nēs'sel-rō'de, KARL ROBERT, COUNT (1780-1862). A Russian diplomat, born at Lisbon, where his father then resided as Russian Ambassador. He devoted himself to a diplomatic career, won the confidence of the Emperor, Alexander I, and was in the diplomatic suite of the latter during the eventful year of 1813 and the negotiations at Paris after the first defeat of Napoleon. He was one of the signers of the treaty of the quadruple alliance at Chaumont and also of the treaty with Marshal Marmont for the surrender of Paris. He was one of the most prominent of the plenipotentiaries in the Congress of Vienna and in 1816 became Minister of Foreign Affairs and accompanied the Emperor Alexander to the congresses of Aix-la-Chapelle, Troppau, Laibach, and Verona, where he always advocated a policy of moderation. Under Nicholas I, Nesselrode became Vice Chancellor (1829) and Imperial Chancellor (1844). It fell to him to direct the Russian policy in the affairs of Greece and Turkey. Nesselrode was opposed to the policy which brought on the War of 1853-56 and retired from the Foreign Office after signing the Treaty of Paris in 1856, though he retained the dignity of Chancellor of the Empire and a seat in the Ministerial Council. He died at St. Petersburg, March 23, 1862. His autobiography, which is not of especial value, was published in 1866.

NESSLER, nēs'lēr, JULIUS (1827-1905). A German agricultural chemist, born at Kehl and educated at Freiburg, Strassburg, and Heidelberg. He established at Karlsruhe the important experiment station which afterward passed under government control. He retired in 1901. Among the preparations known by his name are Nessler's reagent for ammonia, a mixture of iodide of potassium and iodide of mercury with free potash, and Nessler's insect powder, powdered tobacco, fusel oil, soap, and spirits of wine. He described his important studies on the culture of the vine and of tobacco and on the tests of the purity of wine in *Der Wein, seine Bestandteile und seine Behandlung* (2d ed., 1866), *Der Tabak, seine Bestandteile und seine Behandlung* (1867), *Naturwissenschaftlicher Leitfaden für Landwirte und Gärtner* (3d ed., 1896), and *Die Bereitung, Pflege und Untersuchung des Weins* (7th ed., 1897).

NESSLER, VICTOR (1841-90). A German composer, born in Baldenheim, Alsace. He received his musical education in Leipzig, where he was a student of theology, during which period he successfully conducted several singing societies. The success of his opera *Fleurette* (1864) determined his career, and after further study in Leipzig he devoted himself entirely to composition. His works comprise half a score of operas and operettas of varying merit, the most successful of which, *Der Rattenfänger von Hameln* (1879), *Der wilde Jäger* (1881), and

especially *Der Trompeter von Säckingen* (1884), enjoyed immense popularity until the end of the last century. He also wrote choruses, song cycles, and part songs. He died at Strassburg.

NES'SUS (Lat., from Gk. Νέσσοι, *Nessos*). In Greek mythology, a centaur who carried travelers over the river Evenus. When Hercules (q.v.) came with Deianira (q.v.) to the river, he swam across, but allowed the centaur to carry Deianira. Nessus offered violence to her and was killed by Hercules with an arrow that had been dipped in the poison of the Lernaean hydra (q.v.). In revenge Nessus told Deianira that his blood would prove an invincible love philtre. Later, becoming jealous of Iole, she dipped a robe in the blood of Nessus and sent it to her husband, who was so tortured by the poisoned blood that he sought death on the funeral pile. Sophocles deals with this myth in the *Trachiniae*.

NEST. A receptacle for eggs or young, provided by many sorts of animals. The nest reaches its greatest elaboration among birds, where in some cases, as that of the cotton bird, hangnests, weaver birds, etc., it becomes a fabric woven with astonishing ingenuity. The nests of certain swifts (see SALANGANE) are further remarkable for edible qualities. Nests and the habits, instincts, and utilities connected with them are fully discussed under NIDIFICATION.

NEST FUNGI. See BASIDIOMYCETES; NIDULARIALES. Plate of FUNGI, TYPES OF

NES'TOR (Lat., from Gk. Νέστωρ) In the Homeric epic, the type of the wise and vigorous old man. He was said to be a son of Neleus (q.v.) and Chloris, he was not slain by Hercules because he was away at Gerenia. At the time of the Trojan War he had already outlived two generations. He is the persuasive speaker, drawing on his stores of wisdom and experience for the guidance of the younger leaders. On his return to Pylos he punished the neighboring Epeians of Elis for their raids. He even took part in the war between the Lapithæ and the Centaurs, but it is only in later writers that he appears as a participant in the Calydonian Hunt and the Argonautic expedition. His part in the *Iliad* is prominent, the Ionian princes of Asia Minor regarded themselves as his descendants. He appears in the *Odyssey* as safely returned from Troy to Pylos, where he hospitably receives the young Telemachus. Of his death there was no tradition, but Pausanias mentions his grave at Pylos.

NESTOR (1056-1114). The reputed author of the first Russian chronicle of a national character. In 1073 he entered the Petcherski convent at Kiev, where he died after a life of asceticism and holiness. He is reputed to have written the *Lives of Saint Boris and Gleb* and the *Life of Saint Theodosius*, whose relics he is known to have removed in 1091. Owing to some discrepancies between these *Lives* and the so-called Nestor's *Chronicle*, most critics have denied him the authorship of the latter. There is, indeed, no direct evidence of his authorship, and he certainly did not, if at all, write more than a small portion. A note after the year 1110 shows that the subsequent narrative belongs to another person. The original of the chronicle has not come down to us, nor is there any faithful copy of it extant. There are, however, some 170 manuscripts, the outcome of the successive efforts of several editors and continuers. The earliest codex is the *Laurentianus*, written in 1377, and the next the *Hypatianus*, named after

the Ipatievski monastery at Kostroma. Like the mediæval chronicles of Joannes Malalas and Georgios Hamartolos, on which it drew for much information in general history, Nestor's story begins with the distribution of mankind after the flood and then leads up to the Slavs—a branch of the Japhetic race—and their subdivisions. Nestor made use of all possible sources of information. The rapid growth of Kiev inspired the author to a high pitch of patriotism, the narrative often attaining great poetic fervor and charm. The best editions of the *Chronicle* have been published by the Russian Archaeographical Commission at St. Petersburg in 1846 (*Polnoe Sobranie Russkikh Lëtopisei*, vols. i-ii) and 1871-72. Consult the notes of the different editors and translators of the *Chronicle*: Miklosich (Vienna, 1860, Latin), Bielowski (Lemberg, 1864, Polish), Erben (Prague, 1864, Czech), Léger (Paris, 1884, French); M. P. Pogodin, *Nestor*, translated into German by F. Lowe (St. Petersburg, 1844), K. N. Bestuzhev-Riumin, *Quellen und Literatur zur russischen Geschichte* (Ger trans., Mitau, 1876), the authorities listed in Potthast, *Bibliotheca historica Medii Ævi*, vol. ii (2d ed., Berlin, 1896), *Proceedings of the Eleventh Archaeological Meeting at Kiev*, vol. ii (Moscow, 1902), V. O. Klutchevski, *History of Russia*, vol. i (New York, 1911).

NESTORIAN MONUMENT. A stone slab dating from 781 A.D. and the only record yet discovered of the Nestorian movement in China. It was dug up in 1625 at Changan, a suburb of Singan-fu, one of the former capitals of China. The tablet is about 6¼ feet high and 3 feet wide, with a cross carved at the top, below which is a Chinese inscription consisting of 1789 characters, accompanied by further inscriptions in Syriac writing. The part in Syriac contains the date of erection, the names of the Patriarch of the Nestorian church, the Bishop of China (which was designated as *Tzimisthan*), and the names of 67 persons (with 61 in Chinese), most of whom are called priests. The Chinese inscription is in three parts. (1) an outline of Christianity; (2) the labors of the missionary Olopan, who arrived in China in 635, and the account of the church in China for about 150 years, until the erection of the stone in 781; (3) praises of the emperors who favored the religion. The monument was probably buried about 845, when the Emperor Wu-tsung issued his edict against Buddhism and Nestorianism. The first translation of the writings was published by the Jesuit Kircher in 1636, and many other versions have since been made. The stone has been denounced as a forgery by some, including Voltaire, but it is universally regarded to-day as genuine. In 1907 Mr. Frits v. Holm had an exact replica of the tablet made at Singan-fu of the same stone as the original, which he presented to the Metropolitan Museum in New York City. For very complete accounts, consult: Henry Yule, *Cathay and the Way Thither* (2 vols., London, 1866), Holm and Carus, *The Nestorian Monument* (Chicago, 1909); E. H. Parker, *Studies in Chinese Religion* (London, 1910).

NESTORIANS. The name commonly given to one of the schismatic churches of the East, formerly large and flourishing, but now small in numbers and with little influence. The name is derived from Nestorius (q.v.). It was first applied to them by a theological opponent, Philox-

enus, Monophysite Bishop of Hierapolis, about the year 500 A.D., and although the Nestorians themselves never adopted the title, preferring to be known as Chaldaean or Oriental Christians, it passed into common use and has remained their usual designation. The Nestorians claim an apostolic origin for their church, appealing to an ancient tradition according to which the Apostle Thaddæus is said to have carried the Gospel to King Abgar of Edessa, but this story lacks historical confirmation. There is no clear evidence of the presence of Christianity in Persia before about 200, when the Bishop of Antioch held control over that section of the Church. Under the Neo-Persian Kingdom of the Sassanidæ (q.v.), in the third century, a new bishopric was established at Seleucia-Ctesiphon, on the Tigris, which in time assumed ecclesiastical leadership. But it was not until the fifth century that the Nestorians began to call the Bishop of Seleucia their Catholicus, or national patriarch, and it was still longer before his primacy was acknowledged by the other bishops. In 498 he assumed the title of Patriarch of the East.

The chief causes which gave rise to the separate existence of the Nestorian church during the fifth century were as follows (1) the reorganization of the Church by a synod of 40 bishops, held in Ctesiphon in 410, after a severe persecution, (2) the condemnation of Nestorius in 431, (3) the expulsion of Nestorius' sympathizers from Edessa by Bishop Rabulas after the Council of Ephesus, (4) the rise of Nisibis as a centre of Christian learning and theological influence from 435 onward, and (5) the final closing of the school at Edessa by the Emperor Zeno in 489, on account of its persistent Nestorian leanings and the consequent spread of its teachings by the scattered teachers. All these things operated to separate Persian Christianity from organic connection with the see of Constantinople. The Nestorian leaders succeeded in winning favor with the Persian kings to such an extent as completely to control the ecclesiastical situation. They had been aided in the earlier stages of their growth by the prestige of adherents like Aphraates in the fourth century and Ibas, Bishop of Edessa, in the fifth; but their most important leader in the formative period was Barsumas, one of those whom Rabulas had driven out of Edessa in 431. Barsumas became Bishop of Nisibis, and for more than half a century (435-489) he guided the fortunes of the Persian church, wisely administering his see, winning royal favor, and establishing schools of learning (e.g., at Seleucia) to perpetuate the movement to which he had devoted his life.

During the sixth and seventh centuries the Nestorians greatly extended their numbers and influence, reaching out by means of missions into Arabia, Armenia, India, Tartary, Ceylon, and China. An ancient monument, discovered in the seventeenth century, bears testimony to the existence of Nestorian Christianity in China. (See **NESTORIAN MONUMENT**.) In 642, as a consequence of the Arab conquest of the Sassanid Kingdom, the Nestorians passed under Mohammedan rule; but the caliphs granted them a considerable degree of religious toleration, and their Catholicus was treated as if he were Patriarch of all the Asiatic Christians under Moslem rule. He took up his residence in Bagdad (in 762) and there remained as long as the caliphate endured. In Arabia also the Nestorians met with favor in the eyes of their Mo-

hammedan neighbors. This friendly treatment was possibly due in part to the example of Mohammed himself, who is said once to have come into friendly contact in Arabia with a Nestorian monk, named Sergius, from whom he may have gained some knowledge of Christianity and still more to the policy of fostering a division of the Christian Church which was not in accord with the Byzantine empire.

Nestorian Christianity culminated in the thirteenth century, when there were 25 metropolitans in the hierarchy, no one of whom had fewer than six bishops under his jurisdiction. The Catholicus was almost a pope in the extent of his ecclesiastical domain. But from this time onward their prosperity diminishes. After the fall of Bagdad before the Mongols (1258) the Catholicus was obliged frequently to change his residence, which was in itself a serious administrative disadvantage. In the fourteenth century came the Tatars, under the fierce Timur (q.v.), who made sad havoc of the Nestorians. Internal dissensions split the church in the sixteenth century, but those who claimed to be the true Nestorians adhered to the hereditary line of Mar Shimun, the family from which the Catholicus has been chosen ever since the fifteenth century. Their Patriarch always bears the name of Simeon (Shimun). Some ultimately joined the Roman Catholic church, admitting the supremacy of the Pope, but retaining special privileges, such as clerical marriage, which was a very ancient custom among them. These constitute the so-called Uniat Chaldaeans. At present the Nestorians in Kurdistan and Persia number over 150,000, with 250 churches, 12 archbishops and bishops, and over 300 priests. The Chaldaeans are estimated at over 100,000, with 150 churches and more than 250 priests. India has some 120,000 Nestorians and 200,000 Uniates.

The Nestorians take their stand upon the first two ecumenical councils, rejecting the decisions of Ephesus and of course taking no part in subsequent councils of the Catholic church. They have never accepted the supremacy of the Pope, nor the doctrine of transubstantiation, nor purgatory, nor the veneration of Mary, nor the use of images. Their hierarchical organization culminates in the patriarchate. They have sanctioned clerical marriage ever since the fifth century, although this privilege does not extend to the bishops. Ancient Syriac is the language of their liturgy. Their former generous philanthropy, exemplified in the foundation of asylums, almshouses, etc., has vanished along with their general prosperity as a church and people, and at present they are themselves the objects of charity and of missionary effort. Friendly negotiations have been carried on with them by representatives of the Church of England, partly in the hope of bringing about ecclesiastical union. An American Presbyterian mission at Urumiah has had success, especially in educational work. In 1898 the Persian branch of the Nestorian church formally joined the Orthodox church of Russia, thereby gaining the political protection of the Czar.

The Christians of St Thomas, dwelling on the coast of Malabar, India, are historically connected with the Nestorians.

NESTORIUS (Lat., from Gk *Nestórios*, *Nestorios*) Bishop of Constantinople (428-431) and author of the Christological heresy known as Nestorianism. He was born in Syria Euphratensis and was a pupil of Theodore of Mopsuestia, one of the leading theological teachers of Antioch, who was greatly revered throughout the Asiatic section of the Eastern Church.

In 428 Nestorius was summoned from his monastic retirement near Antioch to become Bishop of Constantinople, whither his fame as an ascetic and preacher had preceded him. As Patriarch, Nestorius immediately declared war upon all heretics and began persecutions against Arians, Quartodecimarians, Macedonians, etc. The popular theology of Constantinople did not escape. A presbyter named Anastasius, preaching in the cathedral church one day, declared with energy, "Let no man call Mary 'Mother of God,' for Mary was only a woman, and it is impossible that God should be born of a woman." Nestorius hastened to support and reiterate the position his presbyter had taken, which was an open defiance of the Alexandrian party.

A fierce controversy ensued. Cyril, Bishop of Alexandria, supported by Celestine, Bishop of Rome, published 12 anathemas against Nestorius, to which Nestorius replied in kind. The Emperor, Theodosius II, was obliged to convene a general council to settle the disturbance. It met at Ephesus in 431. (See **EPHESUS, COUNCIL OF**.) Its stormy proceedings were directed by Cyril, and Nestorius was condemned. John of Antioch, who arrived late, entered an unavailing protest against this verdict. The writings of Nestorius were burned by Imperial order, and his followers were branded with the opprobrious name of Simonians. Nestorius was allowed to return to his old monastery near Antioch, where he passed four years. He was then banished to Arabia and afterward to Egypt, where he endured many hardships and won the title of martyr among his followers. He wrote a defense of his life and teaching, of which only a few fragments survive (in the works of his opponents). We have a melancholy picture of the closing years of his life in Evagrius' *Ecclesiastical History*, i, 7, which is evidently colored by the author's hostility. The place and date of his death are unknown. The Nestorians (q.v.), although bearing his name, do not cherish his peculiar teaching. An illustration of Monophysite detestation of his memory is found in the grim ceremony of the Jacobites, who once a year assemble and cast stones upon the spot where his body is supposed to have been buried.

NETHER HOYLAND. See HOYLAND, NETHER

NETHERLANDS, TIE, often called HOLLAND. The country forming, with the coastal region of Belgium, the lowest part of Europe. It is the western continuation of the low plain of north Germany and lies between lat. 50° 45' and 53° 30' N. and long. 3° 22' and 7° 12' E. It is bounded on the west and north by the North Sea, on the east by Germany, and on the south by Belgium. With an area of only 12,648 square miles, exclusive of the Zuider Zee (q.v.) and the Dutch part of the Dollart (q.v.), it is one of the smallest independent states of Europe. A new province of 523,000 acres, to be created by the draining of a part of the Zuider Zee, is projected. The topography has had a leading part in shaping its history. It is nowhere more than 120 miles from the sea, which forms one-half (465 miles) of its boundaries.

Topography. The northern part of the Netherlands is indented by the Zuider Zee, which represents in part an ancient lake, the sea having broken through the intervening land in the thirteenth century. There are many considerable islands along the coast, distributed in two groups. Off the north coast are the Frisian Islands, comprising Texel, Vlieland, Ter Schelling, Ameland, and others. In the southwest are the numerous islands of the great Rhine-Meuse-Scheldt Delta, among which are Voorne, Overflakkee, Schouwen Tholen, North Beveland, South Beveland, and Walcheren. The country is the flattest part of the Continent, mainly a region of monotonous stretches of plains, interrupted only by sand dunes and some other undulations and low hills, particularly in the southeast. One-fourth of this region adjoining the sea front lies below the level of the sea, a considerable part of it in North and South Holland as much as 20 feet. Thirteen per cent lies between sea level and 3 feet above the sea. The mean height of the entire Kingdom is only 30 to 33 feet above the sea, while the culminating height is 1055 feet, in the extreme southeast of Limburg.

Three features, the dunes, dikes, and polders, characterize the north and south belt nearest to the sea. The dunes stretching along the coast were formed by the winds and sea, which heaped up the ocean sands into rows of hills from 20 to 60 feet apart and from 35 to 200 feet high. Wherever they front the coast they are adequate protection against the sea. These sand ridges and hills are sparsely wooded, but are saved from disintegration by natural or cultivated growths of plants. Few parts of them are tilled, but the sandy regions behind them are carefully cultivated. The dikes are gigantic artificial embankments of earth faced with stone or protected by stakes. They guard the country against the sea at the places where there are no dunes. The largest is the Helder Dike. (See HELDER.) There are also smaller dikes, as a precaution against floods, on the banks of the Rhine and other streams. Inside the line of

dunes and dikes are great numbers of polders, which are areas of land inclosed by dikes that not only protect them from floods, but also render it possible to pump out the water from within the inclosure. The land thus won with enormous toil is exceedingly fertile and valuable.

The lands reclaimed from the sea along the coast and the basins of the rivers in the south are the most industrial and populous parts of the Netherlands. Here are the richest pastures, where most of the fine breeds of Dutch cattle are reared and the dairy industry thrives. Back of these lowest lands and polders the remaining 62 per cent of the surface forms a series of zones stretching from southwest to northeast. First, stretch low plains strewn with gravel and sand brought down from the north, with swellings of ground caused by deeper accumulations of this material, and in the east are many moors or bogs covered with moss and heather, many of which have been drained, the peat cut away for fuel, and the land reclaimed for cultivation. Then, along the east border, in Drenthe, Overijssel, Gelderland, North Brabant, and Limburg there are hills of gravel and sand ranging from 150 to over 300 feet in elevation.

Hydrography. The numerous bogs and marshes testify to the imperfect drainage. There are many small streams, but no large rivers except in the south. These large rivers flow in the direction of the general slope of the country from east to west. They are all international streams, important in the commerce of western Europe. The Rhine is the great highway between west Germany and the sea. Entering Holland, it divides into numerous arms, the chief of which are the Waal, the Lek, and the Yssel. Four-fifths of the river trade of Holland is carried on the Rhine and the Waal, making Rotterdam a Rhine harbor. The Meuse (Dutch *Maas*) joins the Waal, thus mingling its waters with those of the Rhine, and is important in the commerce of east Belgium. The Scheldt or Schelde, whose estuary is mainly in the Netherlands, carries ocean vessels to Antwerp, and small boats from the Netherlands ascend the river to the centre of Belgium. Lakes are scattered all over the country. Some of the lakes, such as the large Haarlem Lake, have been drained, and their beds converted into arable land.

Climate. The climate is moist and with small range in temperature. The summers are not very warm, nor are the winters often very cold. With an average annual temperature at Utrecht of 50° F., the mean temperature is 49° F. in the spring and autumn, 64.4° F. in July and August, and 35.6° F. in January. The annual precipitation is about 30 inches, rain falling on about 204 days in the year on the average, snow on 19, and thunder showers occur on 18. The fact that most days are misty and damp, a week of bright weather being a rarity, induces the diseases which characterize such conditions. Marsh fevers are also prevalent in the boggy districts, and though on the whole Holland is regarded as having a healthful climate, the annual death rate in the western lowlands is from 30 to 40 per 1000, which is about one-third greater than in other parts of the Kingdom.

Soil and Vegetation. The country is poor in vegetable products excepting cultivated plants. The most fertile regions are those with a stiff clay soil on the reclaimed lands of the northern and western provinces and on the fluvial clays along the large rivers. These are the chief agri-

cultural and grazing lands, though the zone of cereals and some other crops also extends over a large part of the diluvial sands and gravels of the central regions. About one-fifth of the area is unproductive. The country is almost destitute of timber, scarcely one-fiftieth of the surface being occupied by woods. Pasturage covers about one-third of the country, and the arable lands, including the areas devoted to kitchen gardening, occupy rather less than one-third of the surface.

Fisheries. Fishing is important, the industry being divided into river and coast fishing and the deep-sea fishing. The chief products of the coast fisheries are sprats and the oyster, which thrives in the alluvial mud brought down by the rivers and is protected from high seas by the islands along the coast. The herring fishery is the most important branch of deep-sea fishing, the annual catch averaging upwards of 600,000 tons. In 1907 the herring catch was valued at 10,394,000 guilders, in 1910 at 11,655,000, and in 1912 at 10,764,000. The 1909 census returned 23,182 persons as engaged in the fisheries, etc.

Geology and Mineral Resources. Nearly the whole surface is covered by very recent Quaternary formations, diluvium occupying 40 per cent and alluvium 59 per cent of the area. The coal measures, chalk, and Tertiary sands and loams occupy only about 1 per cent of the surface and are found only in the extreme east and southeast. The diluvium was spread over the country during the Ice age from Scandinavia in the north, while in late stages of the period the Meuse and Rhine, swelled by the great volume of water from the melting ice, spread coarse sand and grit over the south. The winds, sea, rivers, and vegetation coöperated in the formation of the alluvial strata. Most of the country being composed of water or ice-borne debris, the supply of minerals is very small. Building stone is imported from Norway, the lack of this material has stimulated the production of brick and tile, which are made in abundance, chiefly from the Rhine clays, and are of superior quality. Some coal is mined near Limburg, but there is no iron, except a small quantity of bog iron ore obtained from the bog regions of the east. Turf or peat is cut in very large quantities.

Agriculture. Of the Dutch population, the census of Dec. 31, 1899, returned 570,278 as engaged in agriculture, the census of Dec. 31, 1909, 616,395 (504,174 male, 112,221 female). In the northern and western provinces and along the southern rivers agriculture has reached a high degree of development, but so large is the population of the Kingdom that production is insufficient to supply the home demand. For 1913 uncultivated land was reported at 818,179 hectares and cultivated land at 2,444,530. The former was classified as follows: waste land, 515,143 hectares, water and morass, 122,968, dike and road, 53,555, untaxable land, 78,347, building land and park, 48,166. Of the cultivated land in 1912, arable land comprised 822,255 hectares; meadow and pasture, 1,221,876, garden and market garden, 40,578, orchard and nursery, 29,081; forest, 257,939. In 1888 the number of farms was 164,878 (of which 58.5 per cent were worked by the owners), in 1898, 169,659 (56.6); in 1904, 182,566 (54.4); in 1910, 209,156 (50.8; of the total farm area in 1910, 47.1 per cent was worked by the owners). In 1910, farms of 5 hectares or less numbered 109,605, from 5 to 10, 41,439; from 10 to 20, 30,821, from 20 to 50, 23,797; from 50 to 100, 3278; 100 and

over, 216. The leading crops are rye, potatoes and other vegetables, and sugar beets; on the sandy soils rye, potatoes, and buckwheat are conspicuous products, and on the clay soils sugar beets, wheat, and hops. The beets are grown especially on the richer lands along the rivers. Other important crops are oats, peas, beans, and flax. Quantities of vegetables are exported to England, but American wheat is required to supplement the cereal supply, as for bread the people prefer a mixture of rye and wheat. The following table shows for two years the area in hectares and the production of metric quintals of principal crops, with the yield per hectare in 1913.

CROPS	Hectares		Quintals		Qa. ha
	1913	1914	1913	1914	
Wheat	57,147	58,567	1,382,916	1,464,175	24.2
Rye	228,194	228,673	4,227,163	3,717,437	18.5
Barley	26,833	27,101	679,487	698,879	25.3
Oats	140,728	139,945	3,065,136	2,896,861	21.8
Flax	14,650	8,193	*82,577		5.6
Sugar beets	60,300	61,911	16,653,400		276.2
Potatoes	170,000	168,385	25,026,947		147.2

* Seed, fibre, 75,323 quintals

By careful and scientific tillage a large yield per hectare is obtained. The production, especially for export, of bulbs and shrubs is an important industry. Large areas of timber land were long ago cleared for cultivation, and the country is compelled to import most of its timber supply from various parts of Europe and from America.

Stock Raising. As the moist climate promotes the growth of grass, animal rearing is the most important resource of the country. Cattle raising has attained a development equaled in few other countries of the world. Cattle thrive best in the coast provinces. Dairy farming is also far advanced near the sea. butter production is large, and hundreds of thousands of the famous Dutch cheeses are sent to foreign markets. Horses are bred with great success in Friesland, Gelderland, and North Brabant. Sheep are reared more for their flesh than their wool, chiefly in North Holland and in the south. The poultry yards supply large quantities of eggs to England, and many pounds of honey are produced, chiefly among the higher lands of the east. Comparative figures for live stock in 1903 and 1913 respectively are as follows: horses, 295,500 and 334,400, cattle, 1,660,400 and 2,096,600 (cows in milk or with calf in 1913, 1,109,700), sheep, 652,200 and 842,000, goats, 169,500 and 232,500; swine, 882,100 and 1,350,200. Fowls increased from 6,709,600 in 1910 to 7,182,300 in 1913, and beehives from 69,400 to 69,700.

Manufactures. The country is of inferior importance as an industrial state. Coal and iron, the bases of large manufacturing development, are lacking, with the result that manufactures hardly meet the home demand and only a few articles are exported. There are a few coal mines in Limburg, the output in 1912 was 1,725,400 metric tons. The metal industries have been little developed, though coal and iron are brought to Amsterdam, Rotterdam, and The Hague for the construction of railway material, ships, machinery, and hardware. Many of the steel and iron ships owned in Holland are built

in England. Tin plate is produced at The Hague, and gold and silver ware are manufactured at Amsterdam; but few fancy articles in metals are produced. Textile manufactures have been largely developed since the separation from Belgium in 1830. Calicoes are made in large quantities for trade with the East Indies, Africa, and China; the leading factories are in Overijssel and North Brabant. Amsterdam, Haarlem, and Leyden have dye works and calico-printing works. Linen is manufactured chiefly in the southeast and North Brabant. The best quality of sailcloth is made in North Holland and South Holland. Tilburg is the leading centre of the woolen industry, and the carpets of Deventer are in much request, but with the growth of the woolen industries in England, France, and Germany, Dutch woollens have declined in importance. Leather is manufactured in many towns, and earthenware throughout the country. Brick and tile works are found in many places, clay pipes are made in South Holland, Delft still produces the glazed earthenware that made the town famous, Maastricht also produces stoneware and glassware. The diamond cutters of Amsterdam are still famous, though their business is declining on account of the competition of Paris, London, and Antwerp. This industry is entirely in the hands of Jews. Many industries are connected with the transformation of agricultural products, as the manufacture of liqueurs distilled from orange peel and other materials in Amsterdam, Rotterdam, and Schiedam, the same cities also leading in the production of Holland gin, distilled from rye. There were 401 distilleries in 1913, 418 breweries, and 64 vinegar works. Large quantities of cigars and manufactured tobacco are made, the most extensive factories being at Amsterdam and Utrecht. The sugar refineries, chiefly in Amsterdam and North Brabant, are using every year more raw sugar from beetroot and less from sugar cane. In 1913 there were 11 sugar refineries and 27 beet-sugar mills. The amount of raw beet sugar produced in 1912 was reported at 295,914 metric tons, refined sugar, 223,944; bastard, 7244; raw sugar clarified, 431.

Commerce. The Dutch trade, which embraces every continent, is largely maritime. Most exports of home products go to the neighboring countries of Europe. England, Germany, and Belgium are the largest buyers of the live animals, butter, cheese, and oleomargarine which the country exports.

The exports of colonial products are sold all over the world, and a large part of the trade is in the import and reexport of these colonial commodities. The Dutch colonial possessions in the East Indies, extending from Sumatra to New Guinea, are nearly 60 times as large as the mother country and have over six times the population. Most of the tea, sugar, coffee, cinchona, tin, tobacco, indigo, dyewoods, spices, and gums that they export are sent to the Netherlands, chiefly to Rotterdam. Palm oil, rubber, and ivory from the Belgian Congo and guano and nitrates from South America are also imported. Some of these articles are greatly enhanced in value by manufacture in the Netherlands. Quinine, e.g., is prepared for the market in the Netherlands, where also Java raw sugar is refined and Sumatra tobacco is made into cigars. The colonies, on the other hand, buy from the mother country great quantities of cottons and of other goods manufactured for them at home or pur-

chased in other lands and sold by Dutch merchants in the colonies at a large profit. The colonies are the best customers of the Netherlands, excepting Europe.

Most of the imports for home consumption come from northern Europe and the United States. The United States contributes about one-tenth of these imports on an average, chiefly wheat, flour, corn, rye, petroleum, tallow, bacon, leaf tobacco, and lumber. Great Britain, Germany, Russia, and Belgium supply most of the other imports, consisting chiefly of coal, timber, metals, and manufactures. Most of the home trade, as distinguished from the colonial trade, is with these countries. The rapid growth of the imports for home consumption and the exports of home products may be seen from the following table, which shows in millions of guilders the trade in 1913 as compared with the annual average in preceding periods.

	1887-91	1897-1901	1907-11	1913
Imports	1,262	1,887	3,050	3,918
Exports	1,086	1,601	2,442	3,083

Classified imports and exports (special trade) were valued as follows in 1910 and 1912, in millions of guilders.

MERCHANDISE	Imports		Exports	
	1910	1912	1910	1912
Food products	843 1	901 2	822 2	914 1
Raw materials	1,273 0	1,391 3	921 0	1,038 4
Manufactures	572 7	605 0	508 4	544 0
Miscellaneous	544 0	579 9	365 8	558 3

Precious metals	32 4	45 6	14 9	18 3
Total	3,265 2	3,613 0	2,632 3	3,113 1

The percentage of principal imports on total imports (special trade) in 1902 and 1912 respectively was: cereals, 17.79 and 16.20; drugs, chemicals, etc., 13.02 and 10.77; iron (raw and worked), 8.13 and 7.34; coal, 2.59 and 3.43; rice (included above in cereals), 3.04 and 2.75; stone, etc., 3.34 and 2.68; yarn, 1.62 and 1.66; coffee, 2.69 and 1.41; raw cotton, 1.09 and 1.17; raw sugar, 1.65 and 0.69; total of these articles, 51.91 and 45.35. The percentage of principal exports in 1902 and 1912 was: cereals, 14.97 and 12.48; drugs, chemicals, etc., 13.57 and 9.28; iron (raw and worked), 7.40 and 6.01; butter and oleomargarine, 3.43 and 2.80; refined sugar, 2.82 and 1.97; coffee, 1.84 and 1.16; cattle, 0.27 and 0.79; raw cotton, 0.59 and 0.68; yarn, 0.60 and 0.38; total of these articles, 46.06 and 35.55. The table on page 760 shows the trade by countries in 1910 and 1912, in millions of guilders.

The Dutch derive large profit from the forwarding trade. They find the business of carrying freight for other nations a very profitable branch of commerce, and their position at the mouth of the Rhine gives them unsurpassed opportunities to pursue this branch of business. A great deal of the trade of Germany and also of Austria and Switzerland with other countries passes through the Netherlands, and most of it is tributary to Rotterdam, the port of the Rhine.

mouth and one of the greatest forwarding ports of the world. Amsterdam's connection by river and canal with the Rhine enables that city to take a large though inferior part in the transit

COUNTRIES	Imports		Exports	
	1910	1912	1910	1912
Germany	826 1	1,051 1	1,319 9	1,555 0

Other	171 1	261 8	88 9	105 6
Total	3,265 2	3,613 0	2,632 3	3,113 1

trade. The volume of the transit trade in 1912 amounted to 2,287,000 metric tons with transshipment and 12,419,000 metric tons without transshipment.

Free trade is the government policy, duties being levied on a few articles only for purposes of revenue. The chief centres of domestic trade are Rotterdam, Amsterdam, Flushing, Dordrecht (timber), Middelburg, Leyden, Utrecht, Alkmaar, and Hoorn (cheese).

Shipping. Shipping entered at the ports, with cargo and in ballast, increased from 11,989 vessels of 29,856,000 cubic meters net in 1903 to 17,000 of 49,061,000 cu. m. in 1912, and cleared, from 12,012 vessels of 29,679,000 cu. m. to 17,150 vessels of 48,777,000 cu. m. In 1912 vessels entered with cargo had a net capacity of 45,820,000 cu. m. and cleared 29,475,000, in ballast, 3,241,000 and 19,302,000. Entered in 1912, Dutch vessels 4605 of 12,196,000 cu. m., and foreign vessels 12,395 of 36,865,000 cu. m.; cleared, Dutch 4776 of 12,346,000 cu. m., and foreign 12,374 of 36,431,000 cu. m. Steamers and sailing vessels respectively entered in 1912: Dutch, 3897 of 11,949,000 cu. m. and 708 of 247,000 cu. m.; foreign, 11,856 of 36,134,000 cu. m. and 539 of 731,000 cu. m.; total, 15,753 of 48,082,000 cu. m. and 1247 of 978,000 cu. m.; cleared: Dutch, 3903 of 12,068,000 cu. m. and 873 of 279,000 cu. m.; foreign, 11,716 of 35,685,000 cu. m. and 658 of 746,000 cu. m.; total, 15,619 of 47,753,000 cu. m. and 1531 of 1,025,000 cu. m. The port of Rotterdam has a notable preponderance of shipping, as seen in the shipping table, showing the capacity, in thousands of cubic meters, of vessels with cargo entered and cleared at the principal ports in 1908 and 1912.

The Dutch merchant marine on Dec. 31, 1903, numbered 268 steamers of 956,000 cubic meters net and 439 sail of 164,000 cu. m. net, total, 707 vessels of 1,120,000 cu. m.; on Dec. 31, 1912, 367 steamers of 1,632,000 cu. m. and 413 sail of 115,000 cu. m.; total, 780 of 1,747,000 cu. m.

Transportation and Communications. The largest routes of trade by water or rail converge on Rotterdam, Amsterdam, and Flushing. Great ship canals have given their preeminence to Rotterdam and Amsterdam. Rotterdam, near the mouth of the Meuse, was threatened with

being cut off from the sea by accumulations of sand in the river; a new waterway was therefore dug across the Hook of Holland through the dunes to the north of the Meuse, by which ships of the heaviest tonnage now reach the town. Steamers ply between Rotterdam and all the larger ports of western and northern Europe and to the

PORTS	Entered		Cleared	
	1908	1912	1908	1912
Rotterdam	23,779	30,868	10,033	16,820
Amsterdam	5,380	6,073	3,612	4,999
Flushing	1,925	2,338	1,947	2,299
Hook van Holland	778	1,006	1,493	989
Harlingen	440	423	364	436
Terneuzen	458	509	210	180
Total, incl. others	35,796	45,820	20,179	29,475

East Indies and United States. The traffic by sailing ships with the colonies and other distant lands is also important. Amsterdam is also connected by regular lines of steamers with many ports of Europe, America, and Asia. Two ship canals connect Amsterdam with the sea. The older is the North Holland Canal, extending from Amsterdam to Alkmaar and Helder, 52 miles long, completed in 1825. By means of this canal the dangerous passage of the Zuider Zee was avoided. In recent years, however, the importance of the canal declined, as it is not wide enough for the more modern large ships. The North Sea Canal was therefore built between Amsterdam and the North Sea, 16 miles in length and fully meeting the requirements of modern trade. These are the great ship canals of the Netherlands, but the whole country is a land of canals. All the towns and even the villages are connected with one another by these waterways. The larger canals are over 60 feet broad, 6 to 9 feet deep, and sometimes they lie higher than the fields through which they pass. The domestic traffic of the country is carried on the canals. There is little coasting trade, because commodities are carried from one port to another on the canals. The total extent of the canals is nearly 2000 miles, and the length of navigable waters outside of the canals is about 3000 miles.

The railroads are of more importance for international than for internal commerce. They carry most of the freight that England sends into central Europe. Flushing, on the Scheldt, and Hook van Holland, near Rotterdam, are ports on the main rail routes between England and Germany. The length of railway in operation in the Kingdom was 17 kilometers in 1839. It had increased to 176 in 1850, 1419 in 1870; 2610 in 1890; 2771 in 1900, 3190 in 1910, and 3305 (2054 miles) in 1913. Of the 3256 kilometers in operation at the end of 1912, 1792 were comprised in state lines. Good wagon roads in all parts of the country, paved with brick (klinkers), supplement the other excellent means of communication. Their total length is about 3000 miles.

Banking. All banks are private banks, and the Bank of the Netherlands is the only one that is permitted to issue bank notes. The money in general circulation, however, is chiefly silver. Two-fifths of the paper money in circulation must be covered. The bank secured the right to issue bank notes in 1863 for 25 years; in 1888 the right was prolonged for 15 years, with a

continuation for 10 years more unless rescinded by the government or the bank, two years' notice being given. In 1903 the right was renewed for another term of 15 years, with some alterations in the conditions. The Bank of the Netherlands has branches in all important towns and does the same business as other banks, but provides more guarantees. It is the depository of the state funds and of the cash of the Post Office Savings Bank. On March 31, 1914, notes in circulation amounted to 312,856,000 guilders, total exchanges for the year then ended, 902,590,000 guilders (in 1913 specie for notes, 143,483,675, notes for notes, 580,361,385, notes for specie, 127,864,869). In July, 1914, the bank's stock of gold was 160,064,000 guilders, and of silver 9,617,000 guilders. The bank receives $3\frac{1}{2}$ per cent of the profits, the balance being divided between the state and the bank in proportion of two to one. In 1912 there were 284 private savings banks, with 470,333 depositors and 118,935,000 guilders deposits. The State Postal Savings Bank in 1912 had 1,607,016 depositors and 176,657,000 guilders deposits.

Finance. Revenue and expenditure of the government are reported as follows, in thousands of guilders

	1890	1900	1905	1910	1912
Revenue	165,938	155,391	175,963	200,092	212,838
Expenditure	165,938	155,391	175,963	203,947	226,219

The budget for 1915 showed estimated revenue of 216,206,805 guilders (direct taxes, 55,231,000, excise, 63,455,000, customs, 17,281,000), estimated expenditure, 255,100,900 guilder.

standard of value in the Netherlands since 1875 has been gold. The unit of value is the guilder (or gulden or florin). The par value of the guilder is 40 196 cents, or 2.48787 guilders to the American dollar. The 10-guilder gold piece weighs 6 720 grams, 0.900 fine, thus containing 6.048 grams of fine gold. There is also a 5-guilder gold piece. The 1-guilder silver piece weighs 10 grams, 0.945 fine, containing 9.45 grams of fine silver. There is a subsidiary coinage of silver, nickel, and bronze. Metric weights and measures are used.

Population. The total area of the Kingdom, based on a low-tide planimetric calculation, is stated at 40,828 71 square kilometers (15,764 square miles). This figure includes the Zuider Zee, the Dollart, the Wadden (the shallows extending along Friesland and Groningen as far as the Dollart), the rivers of Zeeland and South Holland, and other waters. Exclusive of these waters, but inclusive of waters comprised in the communal areas, the area of the Kingdom is 34,185 81 square kilometers (13,199 square miles). What may be called the land area is 32,600 25 square kilometers (12,588 square miles). According to census returns, the population has been as follows: Jan 1, 1830, 2,613,487, Dec. 31, 1859, 3,309,128, Dec. 31, 1879, 4,012,693; Dec. 31, 1889, 4,511,415, Dec. 31, 1899, 5,104,137; Dec. 31, 1909, 5,858,175. The following table shows by provinces the area (column 1) and the land area (column 2) in square kilometers, the population according to three successive censuses, the density in 1909 per square kilometer corresponding to the areas in columns 1 and 2, and the population as estimated at the end of 1913.

PROVINCES	Area		Population			Density, 1909		Estimated pop., 1913
	1	2	1880	1899	1909	1	2

* 13,199 square miles

† 12,588 square miles

ders. The principal avenues of estimated expenditure were: finance, 51,112,808 guilders, interior, 43,119,653; public debt, 38,593,304, war, 36,889,976, agriculture, industry, and commerce, 28,781,153, marine, 19,095,689, communications, 18,716,913. Direct tax per capita and excise per capita were 5.99 and 6.31 guilders respectively in the decade 1841-50, in 1861-70, 6.05 and 6.49; in 1881-90, 6.16 and 9.78, in 1901-10, 7.25 and 10.08; in 1911, 8.16 and 10.50, in 1912, 8.33 and 10.61.

The public debt in 1890 amounted to 1,073,386,000 guilders, in 1900, 1,145,247,000; in 1910, 1,122,434,000; in 1911, 1,116,652,000, in 1912, 1,163,238,000, in 1915, 1,140,272,000. Interest on the public debt in 1914, 32,471,613 guilders, amortization, 6,121,500.

Money, Weights, and Measures. The

At the 1909 census males numbered 2,899,125 and females 2,959,050. Of males in 1899, 63 per cent, and of females 60.4 per cent, were unmarried. In 1909, 62.3 and 59.8; married in 1899, 33.2 per cent of males and 32.4 of females; in 1909, 34.2 and 33.6. Widowed in 1899, 3.5 per cent of males and 6.9 of females, in 1909, 3.2 and 6.3. Divorced and separated males increased from 3548 in 1899 to 5394 in 1909, females, 5452 to 8184. By nationality in 1909 the population was as follows: Dutch, 5,788,193; German, 37,534; Belgian, 18,338; French, 2645; British, 2102; Austro-Hungarian, 1223; other, 3908. Not stated, 4152. total, 5,858,175. The average annual increase of population in the decade 1880-89 was 0.682 per cent, in 1890-99, 1.026, in 1900-09, 1.776. Calculations for 1910 show an increase of 2.53 per cent, for 1911, 2.36, for 1912, 2.85.

The increase is almost entirely due to excess of births over deaths. In 1902 the marriage rate was 7.58 and, in 1912, 7.65, living-birth rate, 31.8 and 28.1; death rate, 16.3 and 12.3; rate of excess of living births over deaths, 15.5 and 15.8. Of total births, 4.08 per cent were stillbirths in 1902 and 3.75 per cent in 1912. Emigrants from Dutch ports in 1912 numbered 72,509, of these only 2155 were Dutch. The aggregate population of communes with over 20,000 was 28.5 per cent of the total population in 1830, in 1859, 28.4, in 1889, 34.4, in 1909, 40.5, in 1912, 40.6. Communes with over 20,000 numbered 31 in 1909 and 1912. The largest communes, with population calculated for the end of 1913, are: Amsterdam, 595,250, Rotterdam, 459,357. The Hague, 301,851; Utrecht, 124,415, Groningen, 79,082; Haarlem, 71,176, Arnhem, 65,018, Leyden, 59,500, Nijmegen, 59,147, Tilburg, 54,641, Dordrecht, 48,984, Maastricht, 39,429.

Education. Attendance at school was made compulsory in 1900. No religious instruction is given in the public schools, and a very large number of the youth attend denominational private schools. In 1912 there were 3313 public elementary schools, with 18,817 teachers and 566,867 pupils, 2121 private elementary schools, with 12,404 teachers and 365,887 pupils, 171 public infant schools, with 31,416 pupils, and 1111 private infant schools, with 138,769 pupils. The polytechnic school (Delft) had about 70 teachers and 1300 pupils; 104 middle-class schools, 1627 teachers and 15,153 pupils, 11 navigation schools, 98 teachers and 913 pupils, 435 day and evening schools for working people, 3195 teachers and 36,803 pupils; 31 classical schools, 471 teachers and 2527 pupils. The four public universities at Leyden, Utrecht (qqv), Groningen, and Amsterdam had about 300 teachers and 4004 students, of whom 689 were female. Several art schools, museums, and military, music, normal, deaf-mute, and technical schools are supported by the government. The private schools are largely aided by the state. In 1904, 2.1 per cent of the conscripts could neither read nor write; in 1912, 0.8 per cent. Drenthe showed the highest percentage of illiterates, 7.5 in 1904 and 2.6 in 1912.

Religion. There are numerous creeds and sects and complete religious freedom. Most of the Protestants belong to the Dutch Reformed church, and many other sects are represented. The Roman Catholic church is under an archbishop in Utrecht with the bishoprics of Breda, Haarlem, Bois-le-Duc, and Roermond, and the Jansenists are under an archbishop in Utrecht and two bishops in Deventer and Haarlem. The Jews fall into two religious societies, the Dutch Israelites and the Portuguese Israelites. The censuses of 1899 and 1909 respectively returned the population by religion as follows: Dutch Reformed, 2,471,021 and 2,588,261; other Protestants, 599,111 and 746,186; Roman Catholics, 1,790,161 and 2,053,021; Jansenists, 8754 and 10,082; Jews, 103,988 and 106,309, others, including those without creed, 132,102 and 353,158. Most of the Roman Catholics live south of the Rhine, and most of the Jews in North Holland and South Holland. See REFORMATION.

Charities. The state leaves poor relief largely with the religious societies and organized private charity. Mendicancy and vagrancy are treated as crimes. Poorhouses are found in very few communes, and pauperism is decreasing. For 1910 the number of persons in receipt of poor relief,

including temporary as well as continuous relief, was reported at 326,299.

Literature. See DUTCH LITERATURE.

Ethnology. Of the early peoples of the Netherlands little is known, except that portions of the country were inhabited successively by tribes of the Stone, Bronze, and Iron ages. In the time of Caesar the tribes of the swampy lowlands of the south were of Celtic stock, as the Nervii and Menapii. In the north were the Frisians, and in the central portion were the Batavians and Caninefates, of Teutonic stock, speaking Low Dutch. The Batavians belonged to the Chatti, who had moved in from the east, pushing the Celts into the outskirts. During the Roman occupation the Celts of the south were crushed, the Frisians were compelled to pay tribute, and the Batavians were conciliated and later supplied the best of soldiers for the Roman armies. In the fifth century the Roman power was broken by the Germans, and in this period of the swarming of nations the westward-moving tribes overflowed the Netherlands. The Saxons amid these changes occupied the country and crossed over to England. The ethnical components have remained constant in the centuries that have supervened. The home of the Frisians, who in the early part of the Middle Ages dwelt along the coast as far south as the Scheldt, has been contracted to a small area. The anthropological survey of the country shows a preponderance of the long-headed, blond, tall, Teutonic type in the north and east, with cephalic index of from 79 to 80. In North Holland and South Holland there is a large element having Alpine affinity, with cephalic index from 83 to 84. In Zeeland the pure Alpine or Celtic head form is found with an index of from 85 to 88, dark hair and skin, and medium stature, which is 1.655 meters, while that of the Teutonic element, as in Overijssel, is 1.701 meters.

Government. The basis of the present constitution of the Netherlands is the fundamental Law of 1815, as successively revised in 1848, 1884, and 1887. According to this constitution the state is an hereditary monarchy, having the system of parliamentary government. Royal succession is in the direct male line by primogeniture, transmissible, in default of male heirs, to the female line. In default of all legal heirs, the successor is determined by a joint meeting of the two chambers of the parliament (each containing twice the usual number of members). The sovereign attains his or her majority at the age of 18.

The executive power is vested in the sovereign. The legislative power is vested conjointly in the sovereign and the parliament, or States-General. The parliament consists of two chambers with considerable inequality of powers in legislation. The First Chamber is composed of 50 members elected by the legislatures (Provincial States) of the several provinces and from among the highest taxpayers and certain high officials designated by law. Their term is nine years, one-third retiring every three years. Those members not residing at The Hague, the seat of government, are allowed a compensation of 10 guilders per day during the session of the States-General. The Second Chamber is composed of 100 members, elected by direct vote to represent districts. Those qualified to vote for members of the Second Chamber include all male citizens not less than 25 years of age who are owners or tenants of houses or boats (of 24 tons or more) or who

manifest, as by the payment of a direct tax, certain evidences of capacity and business ability. In 1913 the electoral body comprised about 68 per cent of the male subjects of voting age.

The members of the Second Chamber serve for a term of four years and retire in a body. Any Netherlander who has attained the age of 30 years and who is in the full enjoyment of his civil and political rights is eligible to membership in the Second Chamber. The members receive an annual salary of 2000 guilders, besides traveling expenses. The sessions of the chambers are public, although each by a majority vote may hold secret sessions. Either may be dissolved by the sovereign without the sitting of the other chamber being disturbed, but in case of dissolution new elections must be held within 40 days and the chambers convoked within two months. Ordinarily both chambers meet at least once a year and may be summoned in extraordinary session by the sovereign. The presiding officer of each chamber is appointed by the sovereign, but minor officers are elected by the chambers respectively. The First Chamber has no power of initiating legislative measures, its authority being confined to the simple approval or rejection in toto of bills sent to it from the Second Chamber. The Second Chamber has the special power of appointing commissions of inquiry, it shares with the sovereign the right of initiating legislative measures and may amend the bills presented by the government, to it the government must submit the annual budget, and it alone has the right to impeach the ministers before the High Court at The Hague.

The sovereign, who is declared to be inviolable and irresponsible, is required to take an oath to maintain the constitution, the independence of the country, and the liberties and rights of the citizens, and to execute the laws. The powers of the sovereign include the dissolution of the chambers, either jointly or separately, the declaration of war, the superior direction of foreign affairs, the negotiation of treaties with foreign Powers subject to the approval of the chambers, when the cession or exchange of territory is involved or when rights established by law are affected, the command of the army and navy and the appointment of military officers, the superior direction of the colonies, the general administration of the finances, the granting of pardons (but not amnesties), the fixing of salaries of public officers except in case of the judges; and the decision of administrative conflicts between the provinces. The executive powers of the sovereign are exercised through ministers, one of whom must countersign every official act of the sovereign and who thereby assumes the responsibility for it. The political responsibility of the ministers is to the States-General, to each house of which they are entitled to have access, whether members or not, and to speak, although not to vote unless they be members. At present (1915) there are, besides three ministers without portfolio, nine ministers presiding over departments, viz. Foreign Affairs; Interior; Finance; Justice, Colonies; Marine; War; Communications; Agriculture, Industry, and Commerce. Each minister with portfolio receives an annual salary of 12,000 guilders. Besides the ministry there is a Council of State, presided over by the sovereign and consulted on a variety of important matters of state administration.

For the purpose of local government the Kingdom is divided into 11 provinces, and these are

again subdivided into 1121 communes (*gemeenten*). The chief executive authority in each province is a commissioner of the sovereign. In each province is also a representative assembly (Provincial States) consisting of members elected for six years, one-half of the members retiring every three years. The number of members constituting an assembly varies from 35 to 80, according to the population of the province. The powers of the provincial assemblies are in general those of a local legislative body and include such duties as the enactment of ordinances and the levy of taxes. All ordinances to be valid must be approved by the sovereign. The assemblies exercise a supervisory control over the municipalities and elect the members of the First Chamber of the States-General. Ordinarily they hold sessions twice a year and are presided over by the commissioner of the sovereign. For the conduct of the provincial administration a deputation of six members is chosen from the body of the provincial assembly and is known as the Deputed States. In each commune is a local council elected for six years by the same electorate as that which chooses the members of the provincial assembly. The number of members varies from 7 to 45, according to the population of the commune, and one-third of the members retire every two years. The powers and duties of the communal council include the enactment of by-laws and ordinances relating to matters of purely local concern. These are all subject to the veto of the sovereign, while the budget and ordinances for the alienation of municipal property require the approval of the Deputed States of the province. The council is presided over by a mayor or burgomaster appointed by the sovereign for six years. He is the chief executive officer in the commune and is assisted by from two to six aldermen (the number depending upon the population of the commune) elected by the council from its own membership. The mayor exercises a supervisory power over the actions of the council and may suspend its resolutions for a period of 30 days. He also has charge of the municipal police.

The judicial system consists of the High Court of the Netherlands (Court of Cassation), which sits at The Hague, five courts of appeal, 23 district courts, and 106 cantonal tribunals. The High Court has original jurisdiction in matters concerning the state and the royal family, in the impeachment of ministers, and in offenses committed by the higher officials. It has appellate jurisdiction in cases appealed from the provincial courts and the courts in the colonies. All judges are appointed by the sovereign for life, except the cantonal judges, whose tenure is limited to five years, and they are irremovable except by resolution of the High Court. Trial by jury does not exist in the Netherlands. For navy, see NAVIES.

Army. *Higher Organization.*—The system provides for an initial mobilization of four divisions and one cavalry brigade. A division consists of three brigades of infantry, each of two regiments of three battalions; one field-artillery regiment consisting of 12 three-gun batteries, or a total of 36 guns to the division; a company of cyclists, eight machine guns, and one company of engineers. Total strength of a division about 19,000 officers and men. The cavalry brigade of four regiments of four squadrons each has attached to it four three-gun batteries of horse artillery. The total strength of this field army

when mobilized for war is about 125,000 men and 152 guns. The permanent peace strength maintained as the skeleton upon which the field army is mobilized in war consists of about 1500 officers and 22,000 men. *Service*.—Liability to service in time of war is universal and compulsory from the age of 19 to 40. In time of peace, under the Law of 1912, service is partly voluntary and partly compulsory, the larger number of men being from the latter class. The annual contingent is limited to 23,000 men, the selection being by lot and substitution not being permitted. Volunteers enlist for 10 years, of which period only two or three years are with the colors. Re-enlistment of noncommissioned officers is authorized and encouraged. The service of the conscripted militiaman, assigned for training to the permanent units, is divided as follows. (a) active army, six years (eight for mounted troops), of which period two years only are continuous service for mounted troops, 8½ months for infantry. Subsequently during this period the mounted troops may be called out once for a period of one month, the dismounted troops twice for four and three weeks respectively. (b) Landwehr service: seven or five years, during which period the men may be turned out for training twice for six days only. (c) Landsturm service: period eight years. This class includes all men, those who have had active training and those who have not. This completes the liability of 21 years ending at the age of 40.

For each dismounted unit of the active army there is a corresponding unit of Landwehr troops, the necessary skeleton organization being maintained in time of peace.

The fortresses normally are garrisoned by 57 artillery companies organized into battalions of suitable strength for the armament to be manned. In war these troops are supplemented by Landwehr companies. Extensive seacoast and land fortifications are maintained with effective provision for utilizing inundation as a defensive measure. The defensive scheme includes concentration of all the forces in what is called the Holland Fortress, a large area partly surrounded by the sea, and permanent works, the approaches to which may be controlled by inundation.

Arms.—Infantry, the Mannlicher magazine rifle, cavalry, the carbine; field artillery, a late model rapid-fire Krupp gun, 75 millimeters' caliber.

Normal Military Budget.—Home defense about \$14,000,000; colonial defense about \$16,000,000. Surrounded by the sea, Germany, and Belgium, the Netherlands were in a critical political and military situation during the European War which began in 1914 and were forced to expend sums, greatly in excess of the normal annual budget, in military preparations, reorganizations, and increase, and to maintain mobilized large forces. See CAVALRY.

Defense. There are few fortresses protecting the national boundaries. The chief, most effective defense lies in the ability to open the dikes and flood the region between the Lek and the Zuider Zee.

Colonies. The Netherlands are one of the important colonial powers. The Dutch colonies form two groups: the Dutch East Indies (q.v.) and the Dutch West Indies. The statistics—totals—are approximately: estimated area in square miles, Dutch East Indies, 736,400; Dutch West Indies, 46,460; total, 782,860; estimated population of Dutch East Indies in 1905, 37,979,000; Dutch West Indies in 1912, 149,800.

The Dutch West Indies comprise the colony of Dutch Guiana, or Surinam (see under GUIANA), area 46,060 square miles, population 86,134; and the colony of Curaçao (q.v.), including the islands of Aruba (q.v.), Buen Ayre (q.v.), Eustatius (q.v.), Saba (q.v.), and half of St. Martin (q.v.), total area 403 square miles, population 55,200.

History. The name Netherlands or Low Countries originally covered the territory included in the kingdoms of the Netherlands and Belgium, with Luxembourg. This region was inhabited in Roman times by the Frisii in the north, the Batavi in the central portion, and the Belgæ in the south. These tribes were successively subjugated by the Romans—the Belgæ by Cæsar, the Batavi after Claudius Civilis, a Batavian leader, whose native name is unknown, had broken the Roman alliance and attempted to form a united Batavian kingdom (69–70 A.D.), and the Frisii still later after an obstinate resistance. The Low Countries were incorporated in the empire of Charles the Great and Christianized. Upon the breaking up of the Carolingian Empire the new Frankish kingdom acquired the southern portion, Lotharingia (Lorraine) the central, and the new Germany the northern part. Coincidentally with this division came the rise of feudalism, and duchies like Brabant (originally Lower Lorraine), counties like Artois, Flanders, Holland, and Hamault, and bishoprics like Utrecht and Liège developed a semi-independent authority in this remote district, where the weakened royal authority of the period reached with difficulty. (See BELGIUM.) It resulted also from the division of the country that, while the people as a whole retained certain traits due to their environment, the Dutch or northern provinces were distinctly Germanic in language and customs, the Flemings of central Netherlands showed in both respects a mingling of French and German elements, while the Walloons on the south were as markedly French as the Dutch were German. In the latter part of the Middle Ages the cities of the Netherlands rose through their commerce and manufactures to an extraordinary state of prosperity, and some of them were for a time virtually independent republics. Next to the Italian states they figured most prominently in the revival of art. The cities of Flanders and Brabant were especially flourishing. Bruges, Ghent, and Antwerp had the largest share in this prosperity—Antwerp, at the beginning of the sixteenth century, eclipsing all other cities of Europe in the volume of its trade and its financial transactions. A marriage alliance between the house of Flanders and that of Burgundy (1369) gave the Burgundian dukes, with their unbridled ambition for empire, a foothold in the Netherlands which they used to such purpose as to bring the whole country under their sway.

The Hapsburg-Burgundian alliance (the marriage of Maximilian of Austria and Mary of Burgundy) in 1477 made the Low Countries an appanage of the house of Hapsburg. Charles V, the grandson of Maximilian, in 1549 formally united this rich inheritance with the Spanish crown. In 1555 he resigned the sovereignty over the Netherlands to his son Philip II. At this time they comprised the four duchies of Brabant, Gelderland, Limburg, and Luxembourg; the seven counties of Artois, Flanders, Hainault, Holland, Namur, Zutphen, and Zeeland, the

margraviate of Antwerp; and the seigniories of Friesland, Groningen, Mechlin, Overijssel, and Utrecht. These provinces were very largely independent of each other and prized this independence. The States-General, to which each sent deputies, served to unify them to some extent, and a supreme tribunal had jurisdiction over all; but the States-General was, like similar bodies in that age, politically weak, without power of legislation or taxation. The acquisition of the country by Spain brought into close political conjunction two bitterly antagonistic forces, for all save the provinces of southern Netherlands was becoming strongly Protestant, while Spain was the most Catholic country in Europe. Under Charles V the Netherlands, which were included in the Burgundian Circle of the Holy Roman Empire, had been declared indivisible and not subject to the Imperial courts. He had subjected the Protestants to severe persecution and had established the Inquisition, but it was reserved for Philip II to show to what lengths bigotry, cruelty, and bad faith could be carried in the oppression of a people. The government during the regency of Margaret of Parma was carried on by Cardinal Granvelle (qv), who began at once to break the royal pledges and to trample upon the liberties of the people. Spanish troops were kept in the country, and time-honored privileges and rights were ignored. Protests and resistance soon began under the leadership of William of Orange, Stadholder of Holland, Zeeland, and Utrecht, Count Egmont, and the Count of Hoorne, which brought about the dismissal of the hated Minister (1564), but effected no change in Philip's policy towards the Netherlands. The league of the Beggars (see GUEUX) arose in 1566, and field preaching by proscribed Protestant ministers was carried on under the protection of armed multitudes. Mob violence broke out in many parts of the country, and the resentment of the people showed itself in the plundering and desecration of churches and the destruction of images and relics. Philip II proceeded to summary measures, strengthened by the support of a large peaceful element among the population who viewed with alarm the proceedings of the Beggars. In August, 1567, the Duke of Alva (qv) arrived with an army of Spanish veterans and authority to deal with the country as rebellious and conquered territory. Alva's Bloody Council, an irresponsible tribunal, condemned by wholesale Netherlands guilty of no offense save their religion and love of country, and in February, 1568, the Holy Office of the Inquisition pronounced a death sentence against all the inhabitants of the Netherlands as heretics, with a few named exceptions. Among the notable victims of the tribunal were Counts Egmont and Horne. In the spring the Prince of Orange, who had fled the country, raised a small army and with his brother, Count Louis of Nassau, took the field for the liberties of the Netherlands, thus opening a desperate struggle lasting for 40 years, during which most of the principal towns endured sieges by the Spaniards and suffered wholesale massacres when taken. In May, Louis of Nassau defeated Count Aremberg, the Spanish Governor of Groningen, but he was driven from the field by Alva and fled to Germany with only a remnant of his troops. The first decisive triumph for the national cause was the capture of the fortified seaport of Briel by the Beggars of the Sea

under Count de la Marck in April, 1572. This was followed by the revolt of the principal cities of Holland, Zeeland, and Friesland and many cities in Gelderland, and Overijssel. The Prince of Orange was proclaimed as lawful Stadholder of the King of Spain. The fortress of Mons, in the south, was taken by Count Louis of Nassau, but the expected reinforcements from France did not arrive, and the Massacre of St. Bartholomew was a severe blow to the Protestant cause in the Netherlands. Mons was retaken by the Spaniards in September, and in rapid succession other places (Mechlin, Zutphen, and Naarden) fell into their hands, their course everywhere being marked by ruthless cruelty. Haarlem was defended by a garrison of 4000 men against an army of 30,000 men under Don Frederick, a son of the Duke of Alva, and after enduring a siege of seven months surrendered only when reduced to the very verge of starvation. The little town of Alkmaar repelled all assaults by the Spanish soldiery and drove off an army of 16,000 men by cutting the dikes and flooding the country. In 1573 Alva was recalled by Philip II and succeeded by Requesens.

On sea the Dutch repeatedly defeated the Spanish fleets, but on land they suffered a severe reverse in the battle on the moor of Mook, near Nimeguen (April 15, 1574), in which Louis of Nassau and his brother Henry were slain and their entire army destroyed. Leyden, besieged by an army of 8000 Spaniards under Valdez, held out for five months and was saved by the cutting of the dikes, which enabled the vessels of the Gueux to bring relief to the town. The death of Requesens in March, 1576, was followed by a mutiny of the Spanish troops (the so-called Spanish Fury). Freed from all discipline and clamorous for their pay, which had long been withheld, they brought a reign of terror on the country. Ghent, Utrecht, Valenciennes, Maastricht, and Antwerp were taken and plundered, and in the last-named city 8000 citizens are reported to have been put to death. The southern provinces turned in terror to William of Orange for aid and, with the exception of Luxemburg, entered into an alliance with the northern provinces, known as the Pacification of Ghent (Nov. 8, 1576). The authority of Philip was still nominally recognized. The pacification was completed by the Union of Brussels, January, 1577, the object of which was primarily the expulsion of the mutinous Spanish soldiers. The new viceroy, Don John of Austria, the half brother of Philip II, in order to gain time, was compelled on his arrival to grant the demands of the estates and issued the Perpetual Edict, confirming the terms of the Pacification of Ghent. He won a great victory at Gembloux on Jan. 31, 1578, but died in the same year and was succeeded by Alexander Farnese, Duke of Parma, one of the ablest men of his day as well as one of the most unscrupulous, who administered affairs with energy until 1592. A shrewd judge of men, he used bribery as well as force to divide and weaken the resistance, and he succeeded in fomenting dissensions between the northern and southern provinces, which had little sympathy save that arising from resistance to common oppression. The southern provinces were in great part won back for Spain, but at Utrecht in January, 1579, the seven northern provinces—Holland, Zeeland, Gelderland, Utrecht, Groningen, Overijssel, and Friesland—entered into a union that was virtually the founding

of the Dutch Republic, and on July 26, 1581, at The Hague, the seven provinces constituting the modern kingdom of the Netherlands declared their independence. William of Orange became the ruler of Holland and Zeeland, while the sovereignty over the other provinces was offered to the Duke of Anjou, brother of Henry III of France. The latter, however, aroused the enmity of the people by his attempt to seize Antwerp and left the country in 1583. On July 10, 1584, William of Orange was assassinated at Delft by an emissary of the Duke of Parma, but the United Provinces were saved from the full effects of the blow by affairs in France, where the struggle between the monarchy and the Catholic League diverted the attention of the Spanish King and led for a time to the withdrawal of the greater part of the Spanish troops from the Low Countries. In 1585 Antwerp, after a memorable siege of 14 months, was forced to surrender to the Duke of Parma. In 1585 an English army under the Earl of Leicester was sent by Elizabeth to the aid of the Dutch, but the incapacity of their commander made their assistance of little use, and in 1587 Leicester returned to England. The United Provinces nevertheless continued the struggle, guided by the statesmanship of Barneveldt (q.v.) and under the leadership of Maurice of Nassau, the eldest son of William of Orange. Maurice concluded a series of triumphant campaigns with the decisive victory of Nieuport, over the Archduke Albert of Austria, July 2, 1600. On sea the Dutch navies overwhelmed the Spanish forces and made themselves masters of the Spanish-Portuguese possessions in the East Indies. These years of warfare completed the desolation of the Spanish Netherlands. A respite came in 1609 with a 12 years' truce, which was a virtual acknowledgment of the independence of the Dutch Republic. For additional details of the struggle with Spain up to the truce of 1609, see ALVA; EGMONT; FARNESE; GUEUX; JOHN OF AUSTRIA; PHILIP II, MAURICE (of Nassau). WILLIAM I.

Political and religious dissensions now arose in the Republic. The Arminian controversy in the Church mingled itself unhappily with the political differences between Prince Maurice of Nassau and Barneveldt. Finally Barneveldt was seized, condemned without fair trial, and executed May 13, 1619. See BARNEVELDT, DORT, SYNOD OF; GROTIUS.

In the course of the struggle with Spain the foreign trade of the provinces had undergone a rapid expansion. The Dutch East India Company was organized in 1602. After the discovery of the Hudson River by Henry Hudson, sailing for the Dutch East India Company in 1609, the Dutch established by degrees a trading colony in New Netherland, later New York. The New Netherland Company was given a trading charter in 1615, and in 1621 the Dutch West India Company came into existence and began to people the new colony, which remained a Dutch possession until 1664, when it was taken by the English, to be recovered in 1673 for 15 months and then finally lost to the Republic.

In 1621 the 12 years' truce having expired and the Dutch refusing to acknowledge allegiance to Spain, the war was renewed by Philip IV. The Dutch, led by Prince Maurice until his death in 1625 and then by his brother Frederick Henry, with the French as allies, carried on a struggle for the possession of Flanders, the incidents of which served to increase the hostile

feeling between the Catholic and Protestant parts of the country. In the meantime the religious dissensions in the United Provinces themselves died out, and a spirit of toleration arose which made the country the asylum for European Protestant refugees. In 1646 Spain began negotiations for peace with the Republic, and the Dutch, already suspicious of the growing French influence and themselves weary of the long struggle, made terms which became a part of the general Peace of Westphalia in 1648. The United Provinces were now fully recognized as free and sovereign states. The Scheldt was closed to commerce, and the right of the Dutch to a share in the trade of the Indies was acknowledged. William II, who succeeded Frederick Henry as Stadholder of the Republic, attempted to become a sovereign with the aid of France, but died at the age of 24, and the danger his ill-advised attempt had shown led the states to hold the stadholdership in abeyance. Holland, the wealthiest of the provinces, now became the real controlling force, and the executive power in Holland was vested in the Grand Pensionary, an office which from 1650 to 1672 was held by Jan de Witt (q.v.). This was the golden age of the Republic, when its fleets fought successfully against the English (1652-54, 1665-67) and made it the leading sea power of Europe. The prosperity, wealth, and power of the Republic brought it new enemies in the place of decadent Spain. Having united in 1668 with England and Sweden to hold Louis XIV in check, the Republic found itself in 1672 facing both France and England, the former attacking by land, the latter by sea. In this struggle William III, the young Prince of Orange, posthumous son of William II, by his generalship and patriotism won the approval of a large party of the nobles and common people, who demanded the restoration of the stadholdership. France had demanded the restoration of the house of Orange to its authority, but William had declined to receive a gift forced by the enemies of his country. Jan and Cornelius de Witt, who opposed vesting any further powers in the house of Orange, were murdered by a mob (1672), and the Prince of Orange became once more Stadholder and the central figure in the United Netherlands. In the shifting European policies of the succeeding years the Republic found itself sometimes with one ally, sometimes with another, sometimes single-handed, but with the calling of the Stadholder William to the English throne (1688) it was brought into the large scheme of the Grand Alliance against Louis XIV. William of Orange and Heinsius (q.v.), the Grand Pensionary of Holland, were the soul of the resistance to the schemes of the French King. (See LOUIS XIV.) By the Peace of Utrecht in 1713, closing the War of the Spanish Succession (see SUCCESSION WARS), the Spanish Netherlands were handed over to Austria. By the Barrier Treaty, concluded with England and Austria in 1715, the Dutch acquired the right of maintaining garrisons in the fortified towns of the Austrian (Belgian) Netherlands.

There was a decline in the prosperity of Holland in the first half of the eighteenth century. The stadholdership had been again set aside, but it was restored in 1747 and made hereditary in William IV of Nassau-Dietz. There were 40 years of peace, with the exception of a brief naval war with England which broke out at the close of 1780. In 1782 the States-General for-

inally recognized the United States of America as a sovereign and independent nation, being the second government in Europe to do so. The Stadholder's government was essentially aristocratic, and in 1786 the rising democratic tide drove out William V, who, however, was restored in the following year through the intervention of Prussia. The revolutionary movement in France found an echo in the United Provinces, where the democratic party welcomed the conquest of Pichegru (q.v.). The stadholdership was again overthrown, and the Batavian Republic was organized under French sympathizers and in close alliance with France in 1795. Napoleon made the Batavian Republic into the Kingdom of Holland, with his brother Louis as King (1806), but the latter was too faithful to the country to suit his Imperial brother and master, and he was compelled to abdicate (1810), and the country was annexed to the French Empire. In 1813 the French were expelled and the house of Orange was restored, and the Congress of Vienna (1815) annexed Belgium to Holland and created the new Kingdom of the Netherlands under the sovereignty of William I, the son of the last Stadholder. Luxemburg (q.v.) was at the same time erected into a grand duchy for the King of the Netherlands. In the course of the Napoleonic wars England seized the Dutch colonial possessions and at their close was allowed to retain Cape Colony, Ceylon, and a great part of Surinam. The Catholics of the Belgian provinces were not content with the union with Holland and revolted in 1830, and, after fruitless attempts by the King to suppress the revolt, the Powers intervened and created the independent Kingdom of Belgium, under a guarantee of neutrality. (See BELGIUM.) A final settlement with Belgium was not effected until 1839, when Limburg and Luxemburg were divided between the countries. William I abdicated in 1840 in favor of his son, William II, who was better able to enter upon harmonious relations with Belgium.

William II was succeeded by William III in 1849. The country for more than half a century has enjoyed a peaceful and prosperous development, untroubled by other problems than those of national finance, internal politics, and colonial administration.

The last is a question of much magnitude, as the Dutch colonial empire has a population of about 38,000,000 as compared with some 6,000,000 in the home country. The colonial possessions consist, in the Western Hemisphere, of Dutch Guiana and Curaçoa, and, in the Eastern, of Java, part of Borneo, Timor, the Moluccas, Celebes, and the western half of New Guinea. Slavery existed in the Western colonies until 1862 and, until recently, the so-called "culture system," by which the natives were forced to labor for their employers. The more liberal policy which has been adopted has opened the door to private enterprise, substituted more modern forms of taxation, developed an educational system, and established railways. Of all the Dutch colonies, Java is still the most important, containing about three-fourths of the Dutch in the East. The progress of Sumatra is one of the most noteworthy phenomena of recent European colonial history. Celebes and Dutch Borneo are not well developed, the majority of the natives being in a semibarbarous state. In 1902 and 1904 rebellions of a very serious nature occurred in Achin. The conduct

of the Dutch troops was very severely arraigned in the home Parliament, because of their severity in suppressing the rebellion.

The government of Holland maintains colonies for vagrants. The chief institution is at Veenhingen and occupies 3000 acres, where some 4000 men are maintained from periods of six months to not more than three years. A similar institution for women has been established at Leyden.

The constitution, which had been much liberalized under the revolutionary influences of 1848, became fully democratized by the reforms of 1887 and 1896. In 1905 a royal commission recommended the adoption of proportional representation and woman suffrage. It is very probable that the former will be adopted, regarding the latter, progressive advance has been made. Women already possess the right to vote in the proceedings of the dike associations, in 1908 the Lutheran synod gave women the right to vote in ecclesiastical matters.

The two chief political parties in Holland until recently have been the Liberals and the Conservatives, the former composed largely of the representatives in the commercial towns and the latter of Orthodox Protestants and of the Roman Catholic peasantry, and supported generally by the Roman Catholics. Between 1871 and 1888 the Liberals were continuously in power, excepting a short break by the Roman Catholic Conservatives, they held office from 1891 to 1901. A coalition ministry of Conservative Protestants and Roman Catholics came into power and lasted until 1903. During the period from 1905 to 1907 the Liberals regained control. The Conservatives won in the election of 1908, and in 1909 the most remarkable of recent elections was held. This resulted in the election of 60 Conservatives, 40 Liberals, and 7 Socialists. It was believed in some quarters at the time that the election marked the downfall of Dutch liberalism, however, in the election of 1913 the Conservative cabinet was obliged to resign, and the Liberals were able to form a ministry under the leadership of Dr. Cort van der Linden, gaining the support of the Socialists by guaranteeing electoral reform and old-age pensions.

King William III died Nov. 23, 1890, and was succeeded by his daughter Wilhelmina, who was born Aug. 31, 1880. She married Prince Henry of Mecklenburg-Schwerin, Feb. 7, 1901; an heir was born April 30, 1909, amid great national rejoicing. In 1909 the Regency Bill was passed, by which the Dowager Queen Emma becomes Regent in case of the death of Queen Wilhelmina, and, on the death of the former, the Prince Consort during the heir's minority.

Although Holland has not progressed as fast as some of the other European states in the direction of social and political reform, yet it enacted an important social-insurance law. As early as 1894 a royal commission introduced a plan for obligatory accident insurance at the expense of the employers. A bill based on these recommendations became a law in 1901, and this has been amended several times since. By means of this law compulsory accident insurance is established in virtually all the Dutch industries. Sickness insurance is in the hands of some 700 mutual societies. State provisions for insurance against unemployment has been agitated, yet the Ghent system, by which such insurance is administered through the trade-

unions subsidized by the municipalities, still prevails. Recent elections make probable the adoption of old-age and widows' pensions.

The Coast Defense Bill, which was passed in May, 1913, and which provided for the fortification of Flushing and the expenditure of some 12,000,000 guilders, caused much comment in the European press. It was rumored that it was done at the behest of the German government as a protection against a possible English invasion.

Since 1890 the Dutch government has rendered a great deal of aid to the development of agriculture, which is still the greatest industry, the total value of the yearly production of which is some 600,000,000 guilders. Agricultural and horticultural schools have been organized, experimental stations have been established, and cooperative societies for buying and selling have spread all over the country, and everywhere cooperative creameries and credit banks have met the needs of the local farming communities.

In 1908 trouble broke out with Venezuela over the Dutch colony of Curaçoa. On June 23 of that year the Dutch Minister was given his passports, later four Dutch vessels were seized. A protocol was signed in 1909 by which the government of Venezuela agreed to pay an indemnity of 20,000 bolívares and the Netherlands to restore the coast guards captured in 1908.

During the war which broke out in Europe in 1914 Holland and her people played a very memorable part. On Oct 19, 1914, after the fall of Antwerp, over 400,000 Belgian refugees fled to the Netherlands. In January, 1915, it was estimated that 1,200,000 Belgians had been quartered upon this small country, the burden being extremely severe, as the Dutch had to maintain, in addition to the Belgian refugees, an army of 300,000 men to prevent violations of their neutrality. Besides caring for the refugees, the Dutch government granted free use of its railways for the transportation of relief supplies to Belgium and gave to the American Belgian Relief Commission free transmission of letters and telegrams. After the fall of Antwerp, Holland greatly strengthened her barriers by placing barbed wire on all roads leading from Belgium and by guarding especially the territory south of the Scheldt. The preservation of that river's neutrality was a question of much magnitude. Authorities on international law maintained that the Dutch could not permit its navigation by any belligerent Power. The Dutch were in a precarious position in regard to the shipment of goods within their borders by neutral countries intended for belligerent Powers. On Feb 15, 1915, the government of the Netherlands addressed a note to the British and German governments. The former was informed that the Dutch were opposed to the wholesale use of its flag by belligerents, and the latter that the destruction of neutral vessels without search was a contravention of international law and would not be tolerated. During the month of March the destruction of two Dutch merchantmen by a German submarine caused a great deal of feeling among the people. See WAR IN EUROPE; NATIONAL FLAGS, Plate.

NETHERLANDS SCHOOLS OF PAINTING. Under this title may best be grouped Flemish and Dutch schools which sprung from the same source, possess in common certain

distinctive qualities, and have had a similar development. The Flemish school may be said to begin with Huybecht and Jan van Eyck (died 1440), whose remarkable improvement of oil painting revolutionized the art. The chief characteristics of the early Flemish school are a pronounced realism, highly detailed finish, and the use of landscape background; its best painters had a good sense of color, perspective, atmosphere, light and shade. Jan van Eyck founded the school of Bruges, the chief centre in Flanders; Rogier van der Weyden (died 1464) the school of Brabant, with a centre at Brussels, which was more emotional and dramatic in character; and Dierick Bouts, a Dutchman, the school of Louvain, distinguished by its treatment of light and shadow and of the landscape. The chief master of the second generation was Hugo van der Goes (died 1482) at Ghent. The two most important masters of the later fifteenth century headed the school of Bruges: Hans Memling (died 1494), of German extraction, whose works show a gentle spirituality, and Gerard David (died 1523), a Dutchman, in whose art both Dutch and Flemish art of the fifteenth century culminated. In the sixteenth century the chief seat of the Flemish school was at Antwerp, where Quinten Matsys (died 1530) founded a school, which in the seventeenth century found its culmination in Rubens (1577-1640) and his pupils Van Dyck and Jordaens. The productions of the later Flemish school are characterized by brilliant line and color, though they are materialistic and lack beauty of form and tenderness of feeling. Although Flemish as regards its characteristic realism, it was much influenced by Italian painting, especially in color. Contemporary with Rubens and his followers were a number of important genre painters, who were thoroughly Flemish, untouched by Italian influence. The chief representatives were Teniers the Younger, Brouwer, and Gonzales Coques. In the eighteenth century Flemish painting declined and was of little importance.

The painting of the early Dutch school resembles that of the Flemish and was much influenced by the Van Eycks. Haarlem is recorded as being the chief centre, but none of the works of the reputed founder of the school, Aelbert Ouwater (fifteenth century), survive. Its chief masters were Dierick Bouts (died 1475) and Lucas van Leyden (1494-1533). The sixteenth century was a period of Italian influence and unimportant productions, but the seventeenth was the golden age of Dutch painting. Haarlem remained the chief centre, and there was an important school at Amsterdam. With an entire absence of Italian influence there arose an art more realistic, more distinctly national than the Flemish. The overthrow of Spain and Catholicism did away with the demand for religious paintings, and the more specialized modern forms—portrait, genre, landscape, animal, and still life—arose. In these the Dutch achieved a high degree of perfection alike in color and design, but they seldom attempted larger compositions, in which they were indifferently successful. Among the Dutch painters of the seventeenth century the chief masters in portraiture are Frans Hals and Rembrandt; the latter was equally great in landscape and introduced light effects which have not yet ceased to influence painting. In genre painting the most important were Adriaen van Ostade for peasant scenes and Gerard Terburg for more re-

finer subjects, besides Gerard Dou, Jan Steen, Pieter de Hooghe, and Jan van der Meer. The Dutch were the first to practice landscape and animal painting for its own sake; their greatest landscapists were Jacob van Ruysdael and Hobbema, while in animal painting Wouverman, Paul Potter, Adriaen van de Velde, and Albert Cuyp are preeminent. In marines the greatest names are Willem van de Velde the Younger and Backhuysen, and in all the branches of still-life painting the Dutch excelled predecessors and contemporaries. In the nineteenth century a new school, distinctly Dutch, arose, including important artists like Israels, the peasant painter, the brothers Maris in landscape, Mesdag in marines, and Mauve in animal subjects.

Bibliography. The chief source for the lives of the painters, the Vasari of the Netherlands, is Karl Van Mander, *Het schilder-boeck* (Alkmaar, 1604, Fr. trans., Paris, 1885), for the seventeenth century, Arnold Houbraken, *De groote schouburg der nederlandsche kunstschilders* (Amsterdam, 1718). Of modern works, the best general works are: A. A. Blanc, *Histoire des peintres hollandais et flamands* (Paris, 1852-57), Eugène Fromentin, *Les maîtres d'autrefois Belgique et Hollande* (Paris, 1876, Eng. trans. by M. C. Robbins, Boston, 1910), J. F. van Someren, *Essai d'une bibliographie de l'histoire spéciale de la peinture et de la gravure en Hollande et en Belgique* (Amsterdam, 1882), J. C. Van Dyke, *Old Dutch and Flemish Masters* (New York, 1896); F. T. Kugler, *Handbook of Painting—German, Flemish, and Dutch Schools* (Eng. trans., 3d ed., 2 vols., London, 1898); Philipp, *Die Blüthe der Malerei in Belgien und Holland* (Leipzig, 1900-01); Wilhelm Bode, *Great Masters of Dutch and Flemish Painting* (London, 1909), a brief but scholarly treatise, especially good for Dutch painting. For the early Netherlands school: Crowe and Cavalcasse, *Early Flemish Painters* (London, 1872); K. Voll, *Die alt-niederländische Malerei* (Leipzig, 1906), Ernst Heidrich, *Die alt-niederländische Malerei* (Jena, 1910), a popular work, Fierens-Gevaert, *Les primitifs Flamands* (Brussels, 1910-14). For the Flemish school: J. A. X. Michiels, *Histoire de la peinture flamande* (10 vols., Brussels, 1865-76); Max Rooses, *Geschichte der Malerschule Antwerpens*, translated by Reber (Munich, 1880); Van den Branden, *Geschiedenis der antwerpse Schilderschool* (Antwerp, 1883); Camille Wauters, *La peinture flamande* (Paris, 1884), Ernst Heidrich, *Flämische Malerei* (Jena, 1913), for illustrations; Max Rooses, *Art in Flanders* (New York, 1914). For contemporary Belgian painting: Camille Lemonnier, *Histoire des beaux-arts en Belgique* (Brussels, 1881); De Mont, *Die graphischen Kunst im heutigen Belgien* (Vienna, 1902); Camille Lemonnier, *L'Ecole belge de peinture, 1830-1905* (Brussels, 1906). For the Dutch school: Adriaen van der Willigen, *Les artistes de Haarlem* (The Hague, 1870), Henry Havard, *Histoire de la peinture hollandaise* (Paris, 1882; Eng. trans. by G. Powell, New York, 1885); Wilhelm Bode, *Studien zur Geschichte der holländischen Malerei* (Brunswick, 1883); Wurbach, *Geschichte der holländischen Malerei* (Leipzig, 1885); Max Rooses, *The Dutch Painters of the Nineteenth Century* (London, 1898-1905); Hofstede de Groot, *Catalogue Raisonné of the Works of the Most Eminent Dutch Painters of the Seventeenth Century* (ib., 1908 et seq.); G. H. Marius, *Dutch Painters*

of the Nineteenth Century (Philadelphia, 1908); C. H. Caffin, *Story of Dutch Painting* (New York, 1911)

NETH'ERSOLE, OLGA (1870-). An English actress and manager, born in London. She made her London début in 1888 and during the nineties was manager of several London theatres. In 1894 she came to America, where she soon became well known in *Camille*, *Carmen*, *Sapho*, and especially for her Paula in A. W. Pinero's *The Second Mrs. Tanqueray* (1899). In 1902 her performance in New York in *Sapho* provoked such bitter criticism upon the grounds of its impropriety that she canceled her engagements and returned to London, where she appeared in *The Flute of Pan* in 1904 and in *The Labyrinth* in 1905. Two years later, under her own management, she starred in a repertoire of her successes at the Théâtre Sarah Bernhardt in Paris. She returned to the United States again in 1910 and appeared at the New Theatre, New York, in Maeterlinck's *Mary Magdalene*. In 1911 she played the title rôle in *Sister Beatrice* (San Francisco) and in 1912 Helena in *The Awakening of Helena Ritchie* (Birmingham, England). Consult Strang, *Famous Actresses of the Day in America* (Boston, 1899)

NETHINIM, nêthê-nêm' (Heb., given [to God], from nâthan, to give, a late Aramaicizing form of the passive participle *nethumim*). The lowest order of ministers of the temple at Jerusalem, mentioned only in Chronicles and Ezra-Nehemiah. They are distinguished from the Levites, but were of sufficient importance to make Ezra solicitous for a large following of them with his mission to Jerusalem (Ezra viii. 17-20). They enjoyed the immunities of the priesthood (vii. 24), possessed a distinct quarter on the temple hill, along with allotments in the towns (Neh. iii. 31, Ezra ii. 70), and shared in the civic life of Israel (Neh. x. 28). Their name, along with their subordinate position, shows that the caste originally consisted of slaves piously devoted to the sanctuary, like the Greek hierodules, to perform its menial duties. The tradition is preserved that David and his princes "gave" these servants (Ezra vii. 20), one division of them being associated with Solomon (ii. 55). The large number of foreign names among the Nethinim suggests that they were largely drafted from prisoners of war (cf. Josh. ix. 23). Such foreign slaves seem to have been employed in the temple down to the time of the exile at least (Ezek. xlv. 6 f). After a time they were so completely established as a sacred official class that various privileges were accorded to them. They shared with priests, Levites, singers, and porters immunity from taxation (Ezra vii. 24), lived in a special quarter near the water gate (Neh. iii. 26), and joined as full members of the community in the oath not to allow their children to marry foreigners (Neh. x. 28 ff.). But time broke down the racial distinction. The Talmud, with its often abstract view of history, outlaws them as heathen, but this view is contradicted by the Bible. Consult. Baudissin, *Die Geschichte des attestamentlichen Priesterthums untersucht* (Leipzig, 1899); H. E. Ryle, "Nehemiah," in the *Cambridge Bible for Schools and Colleges* (Cambridge, 1893); Joseph Jacobs, *Studies in Biblical Archaeology* (London, 1894); A. H. McNeile, in Hastings and Selbie, *Dictionary of the Bible* (New York, 1909).

NÊTHOU, nâ'thō', PIC DE. The highest peak

of the Pyrenees. It is situated in the Spanish Province of Huesca, immediately south of the French boundary, 40 miles west of Andorra (Map: Spain, F 1). Its height is 11,169 feet, and it forms with the neighboring Pic de la Maladetta (10,867 feet) and Pic du Milieu (11,010 feet) the Maladetta group, a steep and jagged granite mass. On its north slope lies an extensive glacier. The summit is often ascended for the splendid view which it affords.

NETLEY MEDICAL SCHOOL. See MEDICAL SCHOOL, NETLEY.

NETS (AS. *net*, Goth. *nati*, OHG. *nezzi*, Ger. *Netze*). Openwork fabrics, with regular mesh, made by knotting, plaiting, twisting, or weaving, out of linen, cotton, hemp, silk, wire, and other materials. Net making is one of the primitive arts. In the South Sea islands, the natives when first discovered by Europeans, though entirely ignorant of weaving, were skillful in the knotting of nets for catching fish, birds, and animals. In ancient Assyria, Egypt, Greece, and Rome hunting nets were in common use, as is shown by sculptural reliefs and paintings and by literary evidence. The finest and most delicate of nets are those made by hand with needle or bobbin and by lace machines in imitation of them. These are lace nets (See LACE). They are sometimes used plain, often with inserted or appliqué motifs and edgings of hand or machine lace. The meshes of hair nets and veils are particularly large and open. The principal use for coarse and heavy fabric nets to-day is to catch fish, the stationary nets being called seines, the dragged ones trawls. Wire net (or netting, as it is often called) is frequently employed to fence in domestic fowls and small animals and has almost superseded cotton as a material for mosquito net. See TRAPPING

NETSCHER, nê'tshêr, KASPAR (1630-84). A Dutch genre and portrait painter, born at Heidelberg. He studied under Herman Koster at Arnheim and later under Gerard ter Borch at Deventer. After a visit to France he took up his residence at The Hague in 1662. His best work is in portraiture on a small scale and in small genre subjects. Netscher belongs to the commencement of the period of decadence in Dutch art and is lacking in intellectuality, but in his best period is distinguished for the elegance and grace of his figures, especially of women and children, his mellow, golden tone, and his skill in painting textures, particularly white satin. The Dresden Gallery is rich in good pictures by him. They include "Man Writing a Letter" (1665), "Lady with a Spaniel", "Lady at the Piano", two portraits of Madame de Montespan. The National Gallery, London, has his "Lady at a Spinning Wheel" and "Children Blowing Bubbles", the Louvre, his "Singing Lesson" and "Violoncello Lesson", the Metropolitan Museum, New York, the "Portrait of a Dutch Lady" and "A Card Party"; and the Boston Museum, his "Boy and Girl Blowing Bubbles." The Rijks-Museum, Amsterdam, possesses 16 portraits, and several of his best works are in private collections in England. He also painted historical subjects, but with less success. His two sons, CONSTANTYN (1668-1723) and THEODORUS (1660-1732), were also portrait and genre painters.

NETSUKE, nê'ts'-kâ' (from Jap. *ne*, wood, root + *tsuké*, to suspend). A button of wood, crystal, or porcelain, but usually of ivory, by which the Japanese smoker suspends his outfit

of tobacco, flint and steel, pipe, etc., from his girdle. Often the netsuké is elaborately carved and is among the most characteristic products of native skill. The best specimens are valued by both native and foreign collectors. Consult: M. B. Huish, "The Evolution of a Netsuke," in *Transactions and Proceedings of Japan Society of London*, vol. III (London, 1897); R. Graul, "Netsuke," in *Kunstgewerbeblatt*, vol. XVII (N. S., Leipzig, 1905); A. Brockhaus, *Netsuké. Versuch einer Geschichte der japanischen Schnitzkunst* (ib., 1905).

NETTEMENT, nèt'mán', ALFRED FRANÇOIS (1805-69). A French journalist and historian, born in Paris. He early began to contribute to the magazines and was a consistent Catholic in religion and a legitimist in politics. In 1848 he founded the review *L'Opinion Publique* and in it expressed his own opinions so forcibly that, after the coup d'état of 1851, the paper was suppressed and Nettelement imprisoned. Among his works are *Histoire de la Révolution de juillet* (1833), *Histoire de la littérature française sous la Restauration* (1852), *Histoire de la littérature française sous la royauté de juillet* (1854), *Histoire de la Restauration* (1860-68), *Études critiques sur le feuilleton roman* (1845-46); *Vie de madame la marquise de la Roche-Jacquelin* (1858).

NETTER, THOMAS, also called WALDENSIS, from his birthplace, Sadfron Walden, Essex (c. 1375-1430). An English Carmelite monk. He studied at Oxford and rose to eminence as a man of learning and business capacity. He was elected provincial prior of the English Carmelites in 1414 and was confessor to Henry V and to Henry VI. He was the King's representative at the Council of Constance and was sent on an embassy to Poland, Lithuania, and Prussia. He died at Rouen, France, whence he had accompanied the King, Nov. 2, 1430. He threw himself with great ardor into the lists against the Lollards and so won the sobriquet of Prince of Controversialists. His chief writings against them are *Doctrinale Fidei Ecclesie Catholice contra Wiclemistas et Hussitas* and, especially valuable for its documents, *Fasciculi Zizaniorum Johannis Wyclif* (ed. by Shirley, London, 1858).

NETTLE (AS. *netele*, nettle, OHG. *nezzila*, *nezzila*, dim. of *nazza*, nettle, Ger. *Nessel*, Ir. *nenaid*, nettle, probably connected with OPrus. *noatis*, Lith. *noterė*, Lett. *nātres*, Gk. *ἀδίκη*, *adikhē*, nettle). A common name of *Urtica*, a genus of plants of the family Urticaceæ having unisexual flowers. The species are annual or perennial herbs with occasionally shrubby bases, many of them covered with stinging hairs, which emit an acrid juice and pierce the skin when touched, often causing much inflammation and pain, when grasped in such a way as to press the hairs to the stem, no stinging ensues. The species of a number of distinct genera were formerly included in the genus, especially those having stinging hairs, as *Laportea*, *Pipturus*, and *Pouzolzia*. Some of these are shrubs or even trees, the giant nettle tree of Australia attaining great size. The sting of East Indian species is much more severe than that of European and American species. *Urtica crenulata*, or *Laportea crenulata*, is said to produce a sensation similar to the continual application of a hot iron. The roots of nettles, boiled in alum, afford a yellow dye, and the juice of the stalk and leaves has been used to dye woolen stuffs

a beautiful and permanent green. The small nettle (*Urtica urens*) and the great nettle (*Urtica dioica*), introduced European species, are abundant in America. Whatever gives nettles their stinging power is dissipated by boiling. Their high value as food for swine, poultry, and particularly for turkeys, is well known to the peasantry of many countries; the great nettle is cultivated in Sweden for fodder. The seeds are fed to poultry. The stalks and leaves of nettles are employed in some parts of England for the manufacture of a light kind of beer, called nettle beer. The bast fibre of nettles is used for textile purposes. Yarn and cloth, both of the coarsest and finest descriptions, can be made of it. The fibre of *Urtica dioica*, used by the ancient Egyptians, is still employed in Piedmont and other countries. When wanted for fibre, the plant is cut in midsummer and treated like hemp. The names "nettle yarn" and "nettle cloth" are, however, now commonly given in most parts of Europe to particular linen and cotton fabrics. The fibre of *Urtica cannabina*, a native of the south of Siberia and other middle parts of Asia, is much used, and from other species both fine lace and strong ropes can be manufactured. The fibre of *Urtica japonica*, or *Pouzolzia viminea*, is much used in Japan, and also that of *Urtica argentea*, or *Pipturus argenteus*, in the South Sea islands, and of *Urtica gracilis* in Canada. *Urtica tuberosa*, or *Pouzolzia tuberosa*, produces nutritious tubers, which are eaten in India raw, boiled, or roasted. Australia produces a magnificent tree nettle, *Laportea gigas*, abundant in some parts of New South Wales, which sometimes reaches a height of 140 feet, with a trunk of great thickness and very large green leaves which, when young, sting violently. In some places it forms scrub forests, and its stinging leaves form a great impediment to the traveler. The common nettle tree of the United States is a species of *Celtis* (see HACKBERRY); the name "dead nettle" is given to certain species of *Lamium*, a genus of the family Labiata. *Bachmiera nireca*, often called false nettle, supplies China grass or ramie (q.v.).

NETTLE BUTTERFLY. Any of several species of butterflies whose eggs are laid upon the leaves of nettles, viz., *Pyrameis atalanta*, *Pyrameis cardui*, and *Vanessa urticae*, the last, as its scientific name shows, being an especial frequenter of these plants. The two former are cosmopolitan, while the *Vanessa* is European.

NETTLE FAMILY. A family of plants. See URTICACEÆ.

NETTLE RASH. See HIVES, URTICARIA.

NETTLESHIP, HENRY (1839-93). An English classical scholar, born in Kettering, Northamptonshire. He was educated at the Cathedral School, Durham, Charterhouse, and Oxford, where he was elected fellow of Lincoln and gained the Chancellor's Latin Essay prize. From 1868 to 1873 he was assistant master at Harrow. In 1870 he married the eldest daughter of Rev. T. H. Steel, his colleague at Harrow. In 1873 he was appointed fellow and tutor of Corpus Christi College and classical lecturer at Christ Church, Oxford, which appointments he resigned on being made Corpus professor of Latin literature in the University of Oxford in 1878. He published and edited many classical works, among them a commentary on *Æneid*, x, xii, a revised edition of Conington's *Vergil* (1883), and revisions of Conington's edition and translation, in prose, of Persius (1874, 1893).

Lectures and Essays on Subjects Connected with Latin Literature and Scholarship, two series (1885, 1895); *Contributions to Latin Lexicography* (1889). With J. E. Sandys he revised and edited, in translation, O. Seydler's *A Dictionary of Classical Antiquities, Mythology, Religion, Literature and Art* (London, 1891). For a memoir by his wife and a bibliography, consult his *Lectures and Essays, Second Series* (Oxford, 1895).

NETTLESHIP, RICHARD LEWIS (1846-92). An English philosopher. He was born at Kettering and was educated at Uppingham and at Balliol College, Oxford, where he won many university distinctions. There he became a fellow in 1869, and later as tutor he took the place of Thomas Hill Green in the teaching of philosophy at Balliol. He edited the works of Green with a valuable memoir in 1880. Though he made a lasting impression in his own circle at Oxford, he published only a single essay, *The Theory of Education in Plato's Republic* (1880, new ed., 1906). After his death there appeared *Philosophical Lectures and Remains of Richard Lewis Nettleship*, with a biographical sketch (2 vols., 1897, 2d ed., 1901), edited by A. C. Bradley and G. R. Benson.

NETTLETON, ALFRED BAYARD (1838-1911). An American soldier, journalist, and public official, born at Berlin, Delaware Co., Ohio. He studied at Oberlin College, but at the outbreak of the Civil War enlisted as a private in the Federal army and before the conclusion of peace rose to the rank of colonel of the Second Ohio Cavalry (volunteers) and brevet brigadier general. He then studied law, but afterward did newspaper work in Sandusky, Ohio, Chicago, Philadelphia, and Minneapolis. From 1870 to 1875 he was actively interested in the construction of the Northern Pacific Railroad and for the next five years in various mining and manufacturing enterprises. He was Assistant Secretary of the United States Treasury from 1890 to 1893 and for a short time after Secretary Windom's death served as Secretary.

NETTLETON, WALTER (1861-). An American landscape painter. He was born at New Haven, Conn., and graduated from Yale in 1883. His professional training was acquired at the Yale School of Fine Arts, the Art Students' League, New York, and in Paris under Carolus Duran, Alexander Harrison, and others. After 1889 he exhibited frequently at the Salon and also at the important American exhibitions, including those of the Pennsylvania Academy of Fine Arts, Philadelphia, and the National Academy of Design, New York. In 1905 he was elected an associate of the Academy. He received a gold medal at the Society of American Artists, Philadelphia, in 1907. Nettleton is especially known for his Brittany scenes, and for his later work in winter landscapes of the country about Stockbridge, Mass., where he made his home. They display a sure technique, rich harmonious color, and a sincere if somewhat solid treatment. The snow scenes are particularly fine. Some of his works in public collections are: "December Sunshine," Yale Art Museum, and "The Beloved Physician," Jackson Library, Stockbridge, Mass.

NETTLE TREE. American ornamental trees and shrubs of the family *Urticaceae*, known by sundry popular names, as hackberry (q.v.).

NEUBAUER, NOI'BOU-ER, ADOLF (1832-1907). An English Semitic scholar, born in Hungary

and educated at Prague, Munich, and Paris. In 1868 he went to Oxford, where he catalogued the Hebrew manuscripts in the Bodleian Library, of which he was subsequently sublibrarian (1873-99). He was reader of Rabbinical literature to the university in 1886-1900. Neubauer published: *Medieval Jewish Chronicles and Chronological Notes*, in the Semitic Series of the "Anecdota Oxoniensia"; *Histoire de la lexicographie hébraïque* (1861-62); *Géographie du Talmud* (1868), *The Book of Hebrew Roots* (1875), *The Book of Tobit* (1878), *Catalogue of Hebrew Manuscripts in the Bodleian Library* (1886); *On the Dialects Spoken in Palestine at the Time of Christ* (1888).

NEUBER, NOI'BER, FRIEDERIKE KAROLINE (1697-1760). A German actress. She was born in Reichenbach, and her maiden name was Weissenborn. From the undue restraint of her father's house she fled in 1718 with her lover, Neuber, to Weissenfels, where they joined some strolling comedians. Seven years afterward, with another company which she had entirely reorganized, she appeared at Leipzig. Meeting Gottsched, she became a convert to his gospel of French classical methods. In 1737 she presented the play *Vertreibung und Tod des Hanswurst*. A short tour to St. Petersburg (1740) seems to have been the turning point in her career. She quarreled with Gottsched on her return, lost her company twice, and failed in her attempt to rehabilitate her fortunes as an actress in Vienna, Dresden, and elsewhere. Consult the biography by Von Reden-Esbeck (Leipzig, 1881).

NEUBRANDENBURG, NOI-BRAN'DEN-BURK. A town in the Grand Duchy of Mecklenburg-Strelitz, Germany, near the head of Lake Tollense, 16 miles northeast of Neustrelitz (Map: Germany, E 2). Its old walls, still standing, and its four handsome Gothic gates give the town a mediæval appearance. The Gothic church of St. Mary dates from the thirteenth century. Near by is the grand ducal palace of Belvedere. It has a museum of antiquities, a Gymnasium, a Realschule, and an art gallery. There are manufactures of machines, pianos, paper, lumber, dairy produce, and brandy, as well as an important trade in grain and horses. Pop., 1910, 12,348. Neubrandenburg was founded in 1248 by Margrave John I of Brandenburg.

NEUBURGER, MAX (1868-). An Austrian neurologist and historian of medicine, born at Vienna and educated there (M.D., 1893), especially under Puschmann. He settled in the Austrian capital and after 1898 was connected with the university as lecturer on the history of medicine and as assistant professor (after 1904). Neuburger wrote on neurology, but his chief work (written with Pagel, q.v.) is the standard *Handbuch der Geschichte der Medizin* (3 vols., 1903-05). Under the direction of Sir William Osler it was translated into English by Ernest Playfair as *History of Medicine* (1910 et seq.).

NEUCHÂTEL, nê'shâ'tél', or NEUFCHÂTEL. The capital of the canton of the same name in Switzerland, situated on the Lake of Neuchâtel, 25 miles west of Bern (Map: Switzerland, A 2). It is a well-built town, with a picturesque location on a slope 1425-1900 feet above the sea. It has fine public buildings. A beautiful avenue extends along the water front, and one of the squares is adorned with a statue of the Neuchâtel merchant, David de Purry, to

whose generosity the town owes many of its institutions. The twelfth-century abbey church contains a fine monument, erected in 1372, to the counts of Neuchâtel. The old château is now the seat of the cantonal government. Neuchâtel's institutions include the University of Neuchâtel with faculties of letters, science, theology, and law, a valuable natural-history collection, a commercial school, a Gymnasium, an observatory, a museum of natural history, an historical and ethnographical museum, a museum of fine arts, and a public library of 100,000 volumes. There are a number of private boarding schools, attended mostly by foreigners. The industries of Neuchâtel include the manufacturing of watches, electrical apparatus, and jewelry. The trade is of some importance. Pop., 1900, 20,843. 1910, 23,505, chiefly French Protestants. For history, see the article on the Canton of Neuchâtel. Consult August Bachelin, "Neuchâtel and its Environs," in *Europe Illustrated* (Zurich, 1883), and E. Quartier-La-Tente, *Les rues et les édifices de la ville de Neuchâtel* (Neuchâtel, 1897).

NEUCHÂTEL, or **NEUFCHÂTEL** (Ger. *Neuenburg*) A western canton of Switzerland, bounded on the north by the Canton of Bern, on the east by the Canton of Bern and the Lake of Neuchâtel, on the south by the Canton of Vaud, and on the west by the French Department of Doubs. Area, 312 square miles (Map: Switzerland, A 1). The whole country belongs to the region of the Jura and is generally divided into three parts: the region along the lake, ranging in altitude from about 1400 to over 2000 feet and famous for its vineyards, the central portion, traversed by two valleys with an average altitude of 3200 feet and producing principally cereals, and the forest region of the west, devoted chiefly to pastoral purposes. The highest point is the Creud du Van (4800 feet). Hydrographically the canton belongs partly to the Aare and partly to the Doubs. The principal minerals are asphalt, cement, and building stones. Besides agriculture and stock raising, the fundamental industries of the canton, the inhabitants are engaged in watchmaking, distilling, and in manufacturing cables, electrical apparatus, paper, and chocolate. The canton is well known for its sparkling wine and absinthe. The constitution originally adopted in 1858 provides for a grand council elected directly for three years at the rate of one member to every 1200 inhabitants. The five members of the executive council have been elected triennially since 1906. The referendum was adopted in 1879, and the initiative in 1882. For the administration of justice there are a number of justices of the peace, several industrial arbitration courts, and a court of appeals at Neuchâtel. The canton is represented by six members in the National Council. For administrative purposes Neuchâtel is divided into six districts. Pop., 1900, 126,279; 1910, 132,184, mostly French Protestants. Capital, Neuchâtel (qv).

The mediæval countship of Neuchâtel passed in 1504 to the house of Orléans-Longueville. In 1707, on the extinction of the Neuchâtel branch of the latter family, 15 claimants came forward, among them Frederick I., of Prussia, whose mother was a princess of the house of Orange, which was connected by descent with the house of Châlons, to whose overlordship Rudolph of Hapsburg had subjected Neuchâtel in 1288. Frederick I was the successful candi-

date, and from his time Neuchâtel continued associated with Prussia till 1806, when Napoleon bestowed it upon General Berthier. In 1814 it was restored to the house of Brandenburg and in the same year became a member of the Swiss Confederacy. It became a Republic in 1848. Its connection with the Prussian monarchy has been dissolved since 1857.

Consult: L. Grandpierre, *Histoire du canton de Neuchâtel sous les rois de Prusse* (Leipzig, 1889); E. Quartier-La-Tente, *Le canton de Neuchâtel: revue historique et monographique* (Neuchâtel, 1895); Numa Droz, *La république neuchâteloise, ses origines et son développement* (Paris, 1899). Diacon and Rousselot, *Guide du canton de Neuchâtel* (2d ed., ib., 1902); A. Pfleg, *Die schweizerische Uhrindustrie* (Leipzig, 1908).

NEUCHÂTEL, LAKE OF (Ger. *Neuenburger See*). A lake in the western part of Switzerland lying along the east base of the Jura Range, 19 miles north of the Lake of Geneva (Map: Switzerland, A 2). It is 24 miles long and from 2 to 5 miles wide, being the third largest lake of Switzerland. Its shores, which are very little indented, are partly low and marshy, partly hilly, and covered with forests or vineyards. Successive drainage has brought to light the remains of many lake dwellers. The lake may be considered as an expansion of the river Thûle, which enters at the south end, and leaves it at the north on its way to the Aare. It was an important commercial route until railroads were built along its banks, and is traversed by regular lines of steamers between the towns of Neuchâtel and Estavayer.

NEUDÖRFER, *noï'dër-fër*, JOHANN GEORG (1497-1563). A German writing master and calligrapher, born at Nuremberg. He became the foremost representative of his profession, which, despite the invention of printing, was still widely and skillfully practiced and highly esteemed. His manuscripts were beautifully decorated with gold and other colors, but his chief attention was directed towards an elegant formation of the letters of the German alphabet. He thus developed the German Gothic characters to their perfection and secured their general use. Of his autographs there are known to exist only the signatures to the Gartner copies of Durer's two paintings, "The Temperaments" (in the Germanic Museum, Nuremberg), and a letter of June 7, 1556 (in the municipal archives of Nuremberg). He also wrote in 1547 the *Nachrichten von nürnbergischen Künstlern und Werkleuten daselbst* (new ed. by Lochner, Vienna, 1875), whose 79 brief notices are important sources regarding the history of Nuremberg of the early sixteenth century.

NEUENDORFF, *noï'en-dörf*, ADOLF (1843-97). A German-American musician, conductor, and operatic impresario. He was born in Hamburg, Germany, but at the age of 12 came to America, where he completed his musical education. He first came before the public in 1859 as a concert pianist, and in 1860 became the solo violin in the Stadt Theater orchestra of New York. The following year he toured Brazil, and on his return was appointed musical director of the German Theatre in Milwaukee, Wis. To him is due the credit of introducing Wagner's *Lohengrin* into the United States, at the Stadt Theater, New York (1871). He also introduced

Wachtel (the famous tenor), and the following year (1872) conducted the season of grand opera at the Academy of Music (New York). *Die Walküre* also received its first presentation in this country at his hands (1877), and in 1878 he was appointed conductor of the New York Philharmonic Society. From 1884 to 1889 he was a concert director in Boston, after which he became associated with the management of several successful opera companies. His wife, Georgine von Januschowsky (1859-1914), was prima donna of the Imperial Opera, Vienna, in which city he spent two years (1893-95), returning in 1896 to become musical director of the Hebrew Temple Emanu-El. In 1897 he conducted the Metropolitan Orchestra. He composed operas, symphonies, overtures, and many songs.

NEUNKIRCHEN, noi'en-kêrk'en A town of Austria. See NEUNKIRCHEN.

NEUFCHÂTEAU, nê'shâ'tô', CÔUNT FRANÇOIS DE See FRANÇOIS DE NEUFCHÂTEAU.

NEUFCHÂTEL, nê'shâ'têl'. See NEUFCHÂTEL.

NEUFVILLE, FRANÇOIS DE. See VILLEROI, DUKE DE.

NEUHAUS, noi'hous A town of Bohemia situated 70 miles south-southeast of Prague (Map: Austria, D 2). It contains a mediæval castle with a fine gallery of paintings, a thirteenth-century Gothic parish church, a Franciscan monastery, a museum, and a college. Manufactures include silk, cotton and woolen goods, embroidery, lace, starch, sirup, lumber, beer, and brandy. Pop. (district), 1910, 52,409.

NEUHÄUSEL, noi'hoi-zel (Hung. *Erschújvár*) A town in the County of Neutra, Hungary, situated on the Neutra, 55 miles northwest of Budapest (Map: Hungary, F 2). It has a fine church, a Franciscan monastery, and a Gymnasium. There are manufactures of textiles and shoes, and the town is a good grain and horse market. Prior to 1724 it was a strong fortress and played a prominent part in the Turkish wars. Pop. (district), 1910, 34,442, mostly Catholic Magyars.

NEUHOF, noi'hôf, THEODOR STEPHAN VON, BARON (c.1686-1756). A German adventurer and King of Corsica. He was born in Metz, the son of a Westphalian nobleman in the French service, and became page to the Duchess of Orléans. He then enlisted in the French army and later in the army of Sweden, where the Minister Goertz discovered him and employed him on secret diplomatic missions. In Spain he married a daughter of Lord Kilmallock and ran away with her diamonds to France. Beggared by Law's financial schemes, he lived in misery till 1732, when the Emperor Charles VI made him chargé d'affaires at Florence. In Florence Neuhoof rendered some service to several Corsican patriots, who in return invited him to become King of Corsica. He landed in Corsica in March, 1736, was proclaimed King as Theodore I, and with help obtained from the Dey of Algiers defeated the Genoese. He left the island soon to seek assistance abroad, and came back in 1738 with reinforcements from Holland. But the French had come to the aid of the Genoese, and Neuhoof fled. He made one more attempt on Corsica in 1743, but failed, and after long wandering went to England in 1749. There he was thrown into prison by his creditors and was released through the intercessions of Horace Walpole. Neuhoof's son published his life in *Mé-*

moires pour servir à l'histoire de Corse (1768). Consult Fitzgerald, *King Theodor of Corsica* (London, 1890).

NEUHUYS, nê'hois, ALBERT (1844-1914). A Dutch genre painter, born in Utrecht. He studied under Craeyvanger and at the Antwerp Academy, and started as an historical and portrait painter, but after 1870 turned to interiors. When Israëls had ceased to paint, Neuhuys became the most distinguished of the Dutch artists devoted to the portrayal of peasant life. His cottage pictures possess much the same characteristics as those of Israëls, but in their rich, refined color scheme and admirable handling of lights and shadows bear more resemblance to Jacob Maris. They are to be found in many galleries and private collections in Europe and America. The Metropolitan Museum, New York, has one of his typical Dutch interiors, the Rijks-Museum two, the Dordrecht Museum one. He was awarded gold medals at Munich, Vienna, Paris, and Chicago. His home was in Amsterdam.

NEUILLY, nê'yê' A northwest suburban municipality of Paris, in the Department of Seine, on the right bank of the river Seine (Map: Paris and vicinity). It is a favorite residential section of Parisian merchants and has sanatoriums, hospitals, and five parks, and, in connection with Parisian houses, establishments manufacturing patent leather, carpets, chemicals, perfumery, dyes, chocolate, varnish, starch, and automobiles. In a large and beautiful park along the Seine formerly stood the Château de Neuilly, built by Louis XV, and the favorite residence of Louis Philippe, who after his deposition assumed the title of Count of Neuilly. The château was destroyed in the revolution of 1848. Pop., 1901, 37,493, 1911, 44,616.

NEUKOMM, noi'kôm, SIGISMUND VON (1778-1858). An Austrian composer and orchestra leader, born at Salzburg. He studied under Weissauer the organist and Michael and Joseph Haydn, the latter of whom was mainly instrumental (in 1804) in securing for Neukomm the leadership of the German opera at St Petersburg. In 1809 he went to Paris, where he gained the friendship of Grétry, Cherubini, and Talleyrand, and in 1815 received the cross of the Legion of Honor. In 1816 he went to Rio de Janeiro and was appointed music teacher to the Crown Prince Dom Pedro. He returned in 1821. He was a prolific composer and has nearly 300 compositions to his credit. Of these his sacred works continued to enjoy great popularity for some time after his death, which occurred in Paris.

NEUMANN, noi'mân, ANGELO (1838-1910). An Austrian operatic impresario, born in Vienna. After 1859 he sang tenor parts in the opera at Cracow, Odenburg, and Pressburg, was a member of the Vienna Royal Opera in 1862-76; and in the latter year became director of the opera at Leipzig. The success of his presentation of Wagner's *Der Ring des Nibelungen* in Berlin and in London led him to establish in 1892 a traveling Wagnerian company, with which he toured Europe. At the end of 1882 he assumed direction of the Stadttheater at Bremen, and after 1885 was director of the German Landestheater at Prague. Neumann is author of *Erinnerungen an Richard Wagner* (1907; 4th ed., 1908; Eng. trans. by E. Livermore, *Personal Recollections of Wagner*, 1909).

NEUMANN, FRANZ ERNST (1798-1895). A

German physicist, born at Joachimsthal, near Berlin. He took part in the War of 1815 and afterward studied at the universities of Jena and Berlin. Neumann received his doctor's degree in 1826, and in 1828 he was made professor of physics and mineralogy in the University of Königsberg. He contributed to the theories of the reflection and refraction of light and of double refraction, to the study of crystals of double axes, and to the methods of determining the specific heat of bodies. From his work on specific heat he established (1831) Neumann's law, that the molecular heat of a compound is equal to the sum of the atomic heats of its constituents. Neumann's chief publications are: *Vorlesungen über die Theorie des Magnetismus* (1881), *Einleitung in die theoretische Physik* (1883), *Vorlesungen über elektrische Ströme* (1884), *Vorlesungen über theoretische Optik* (1885), *Vorlesungen über Theorie des Potentials* (1887), *Ueber ein allgemeines Princip der mathematischen Theorie inducirter elektrischer Ströme* (1892). About 100 of his memoirs appeared in the *Annalen*, *Crelle's Journal*, and the *Astronomische Nachrichten*. Consult Volkman, *Franz Neumann* (Leipzig, 1896).

NEUMANN, KARL FRIEDRICH (1793-1870). A German Orientalist and historian, born at Reichmannsdorf, Bavaria. He was educated at the universities of Heidelberg, Munich, and Göttingen, in 1821-25 was an instructor in the Gymnasium at Speyer, and later, at the Mechitarist cloister and academy on the island of San Lazzaro, Venice, made a study of the Armenian language and literature, some results of which appeared in his *Geschichte der armenischen Literatur* (1836). He also made several translations into English of Armenian chronicles for the Oriental Translation Fund of London. During a visit to China he acquired an extensive knowledge of the Chinese tongue and a library of 12,000 printed books, which he presented to the Bavarian government. In 1833 he was appointed at Munich professor of the Armenian and Chinese languages, but in 1852 was retired because of his expression of liberal political views. He further wrote several works on the history of the Far East, a *Geschichte des englischen Reichs in Asien* (1857), and a *Geschichte der Vereinigten Staaten von Amerika* (1863-66).

NEUMANN, KARL GOTTFRIED (1832-). A German mathematician, son of Franz Ernst Neumann, the physicist. He was born and educated in Königsberg, was professor at Halle, Basel, and Tübingen, and in 1868 became professor at Leipzig, founding in the same year the *Mathematische Annalen*. He retired in 1911. Neumann devoted himself mainly to the theory of functions and to mathematical physics, and may be considered the founder of the theory of logarithmic potential. Neumann edited various papers written by his father and published *Theorie der Besselschen Functionen* (1867), *Ueber die elektrischen Kräfte* (1873, 1898), *Vorlesungen über die mechanische Theorie der Wärme* (1875), *Untersuchungen über das logarithmische und Newtonsche Potential* (1877), *Hydrodynamische Untersuchungen* (1883), *Vorlesungen über Riemanns Theorie der Abelschen Integrale* (1884), *Allgemeine Untersuchungen über das Newtonsche Princip der Fernwirkungen* (1896).

NEUMANN, KARL JOHANNES (1857-). A German classical scholar, born at Glogowo

and educated at Strassburg, where he later became professor of ancient history. His numerous publications include: *Julian Imperatoris Librorum contra Christianos quæ Supersunt* (1880), *Strabons Landeskunde von Kaukasien* (1883), *Julians Abfall von Christentum* (1884), *Der römische Staat und die allgemeine Kirche bis auf Diocletian* (1890), *L. Junius Brutus der erste Consul* (1901), *Die hellenistischen Staaten und die römische Republik* (1909), *Römische Staatsaltertümer* (1911, 2d ed., 1913).

NEUMANN-SPALLART, FRANZ XAVER VON (1837-88). An Austrian economist, born and educated in Vienna. He was professor of economics there in the commercial academy (1864-68), at the military academy (1868-71), and at the university and the agricultural college (1872). With Bodio he was one of those most influential in forming the International Statistical Institute, and he was long connected with the Austrian Central Commission on Statistics. As an economist he was a zealous worker in the interest of free trade in Austria and founded the Association for Economic Progress. Neumann published *Oesterreichs Handelspolitik* (1864), *Volkswirtschaftslehre mit besonderer Anwendung auf Oesterreich und Militärverwaltung* (1873), and the valuable yearbook *Uebersichten in der Weltwirtschaft* (1878-87), continued by Juraschek.

NEUMARK, NOI'MARK, GEORG (1621-81). A German poet. He was born at Langensalza and studied at Königsberg. At Kiel, where, after wandering about in poverty, he was engaged as a tutor, he wrote his famous song "Wer nur den lieben Gott lässt walten." Neumark was a member of the poetical guild called the Palmenorden, and he wrote its history, *Der neuwspessende deutsche Palmbaum* (1668). Consult the selected poems in M. Müller, *Bibliothek deutscher Dichter des 17. Jahrhunderts*, vol. ii (Leipzig, 1828, and Knauth, *Georg Neumark nach Leben und Dichten* (Langensalza, 1881).

NEUMAYER, NOI'MI-ER, GEORG VON (1826-1909). A German meteorologist and hydrographer, born at Kirchheimbolanden, Bavaria. He was educated at the Polytechnic and the University of Munich and at the nautical school at Hamburg, and in 1857 was sent by Maximilian II to Australia to make magnetic observations. At Melbourne Neumayer founded the Flagstaff Observatory. He returned to Germany in 1864, interested himself in the formation of expeditions to the north and south poles and in founding the German African Company, and, after a long connection with the hydrographic bureau at Berlin, in 1876 became director of the German Marine Observatory at Hamburg. He held this position until 1903, when he retired. Neumayer wrote *Results of the Observations at the Flagstaff Observatory* (1858-63) and *Results of the Magnetic Survey of Victoria* (1869), *Anleitung zu wissenschaftlichen Beobachtungen auf Reisen* (1875; 3d ed., 1905), *Beobachtungsergebnisse der deutschen Stationen im Systeme der internationalen Polarforschung* (1886), with Borgen, *Die deutsche Expedition und ihre Ergebnisse* (1890-91), *Atlas des Erdmagnetismus* (1891), *Anemometer-Studien* (1897), *Auf zum Südpol!* (1901).

NEUMAYR, NOI'MIR, MELCHIOR (1845-90). An Austrian geologist. He was born in Munich, studied there and at Heidelberg, where, after four years in the Imperial Geological Institute at Vienna, he became docent in 1872. He soon re-

turned to Vienna and became full professor of geology and paleontology in 1880. Neumayr traveled widely in southern Europe and Asia Minor, making an especial study of the life and coordination of the Jurassic formations, the results of which appeared in the German geological magazines. He cooperated on *Geologische Studien in den Küstenländern des griechischen Archipels* (1880), and wrote *Die Stamme des Tierreichs: Wirbellose Tiere* (1890) and a general work on geology entitled *Erdgeschichte* (1885-87; 2d ed., 1895). The last-named work, while written in a popular style, may be commended for its comprehensiveness and scientific accuracy.

NEUMEISTER, noi'mis-tēr, ERDMANN (1671-1756). A German clergyman and hymn writer, born at Uechteritz, near Weissenfels, and educated at the University of Leipzig, where he was later professor of poetry. He is chiefly remembered for his hymns, some of which are of great merit and are still in use, such as "Jesus nimmt die Sunder an," "Will ich sagen," and "Lass irdische Geschäfte stehn," which have been translated into English. He wrote the text to Bach's cantatas. He also published a *Specimen Dissertationis Historico-Criticae de Poetis Germanicis* (1695). His poetical works include *Fortgesetzte Fünfjache Kirchenandachten* (1716-17) and *Zugang zum Gnadenstuhle* (1705). Consult the *Allgemeine deutsche Biographie*, vol. xxiii, p. 543, vol. xxviii, p. 808 (Leipzig, 1886, 1889).

NEUMES, nūnz (OF. *neume*, from *ML. neuma, pneuma*, song, musical sign, from *Gk. pneûma, pneuma*, breath, from *πνέω, pnein*, to breathe). In Gregorian music, melodic ornaments, especially series of notes sung to one syllable. Also characters in a peculiar system of musical notation which was in use from the eighth or ninth to the eleventh century. The oldest preserved manuscript written in this notation is the Antiphony of St Gall (ninth century). No staff was used. The notes were represented by a system of dots and hooks and their respective pitch by the height at which they were placed above the syllables of the text. A single long note was indicated by the *virga* (), two notes on one syllable by the *birga* ()), three by the *trivirga* ())), etc. A shorter note was indicated by the *punctus* (•), two by the *bipunctus* (••), etc. The rising and falling of the voice was marked by a corresponding higher or lower position of the signs. In order to obviate the difficulty of determining the exact pitch of the various tones, a red line was drawn horizontally across the parchment (tenth century), and the signs were written above and below this line. Any sign upon the line denoted F. Before another century a second line was drawn above the red one. This was yellow and the note upon it was C. But in the plainer manuscripts the distinction of color was soon abandoned, and two black lines were drawn with the letters F and C placed at the beginning. In the course of time these letters underwent a series of conventional modifications, until they finally assumed the shape in which they are used to-day as clef signatures ( ). The G clef, which was added later, underwent a similar change . See MENSURABLE MUSIC,

MUSICAL NOTATION, PLAIN CHANT. Consult: M. G. Houdard, *Le rythme du chant dit Grégorien après la notation neumatique* (Paris, 1897); O. Fleischer, *Neumen-Studien* (3 vols., Berlin, 1904); P. Wagner, *Neumenkunde*, part ii of *Ein-*

führung in die gregorianischen Melodien (Freiburg, 1905).

NEUMÜNSTER, noi'mun'stēr. A manufacturing town in the Province of Schleswig-Holstein, Prussia, on the Schwale, 38 miles north of Hamburg (Map: Prussia, C 1). The principal products are leather, paper, cartons, cloth, enamel ware, machinery, and ironwork. It has railway shops. Pop., 1900, 27,335, 1910, 34,555.

NEÜNKIRCHEN, noi'nkêrk-en, or **NEU-ENKIRCHEN**. A market town in the Austrian Crownland of Lower Austria, on the Schwarza, a branch of the Danube, 39 miles south-southwest of Vienna (Map: Austria-Hungary, E 3). It lies in an important coal-mining district, has a large iron foundry, and manufactures textiles, metal work, screws, paper, ultramarine, and boilers. Pop. (district), 1910, 70,543.

NEUQUÉN, nã'oo-kân'. A territory of Argentina, situated on the west frontier of the Republic, and bounded by Chile on the west, the Province of Mendoza on the north, and the Territory of Río Negro on the east and south (Map: Argentina, F 5). Its area is about 42,345 square miles. The western part of the territory is covered by ramifications of the Andes, with intervening fertile valleys. The eastern portion is an elevated plain, lacking in rainfall and with meagre vegetation. A large part of the territory is watered by the headwaters of the Río Negro. There are numerous lakes, the principal one being Lake Nahuel-Haupi (qv) on the south boundary. The climate is dry, cool, and healthful. Agriculture and stock raising are the chief industries. Gold, silver, copper, coal, and petroleum are found, but mining is undeveloped. The territory is connected with Bahía Blanca and Buenos Aires by the Great Southern Railway. Pop., 1895, 14,517, 1912 (official estimate), 29,746, mostly Indians, though many Chileans have settled in the territory since the Indians were subjugated in 1884. The capital is Neuquén (pop., 1500).

NEURALGIA (Neo-Lat., from *Gk. νεῦρον, neuron*, nerve + *ἄλγος, algos*, pain). A sensory neurosis classed as functional and characterized by pain in the course of a nerve or nerves. The causes for neuralgia are legion, and more than one factor may be operative in a given case. It is not a disease of late life, but arteriosclerosis, a phenomenon of old age, is not an infrequent cause. Children rarely suffer from it. Neuralgias are divided into classes named from their underlying causes, as gouty, traumatic, hysterical, etc., as well as from their anatomical location, as trigeminal, lumbar, crural, sciatic, gastric, renal, visceral, cervico-occipital, brachial, and intercostal. The trigeminal, or facial, neuralgia is the most frequent, and the sciatic ranks next in frequency.

The most prominent symptom is pain, which is of a sharp, lancinating character or of a dull aching variety. Generally it appears in twinges of short duration, though of great intensity. Though principally following the course of the nerves, neuralgic pain pervades adjacent structures. Heat as well as cold generally increases it, as well as a light touch. Firm pressure sometimes relieves. In many cases painful points, generally corresponding to the places of exit of nerves from a bony structure, are found by testing with pressure. Numbness may accompany the pain, as well as muscular spasm in rare cases. The pain of neuralgia is usually increased

at night. It may return at regular intervals during the day, especially if dependent upon neuritis.

The treatment of neuralgia includes the use of rest, catharsis, the analgesics, hypodermic exhibition of morphine, as well as the local use of menthol, camphor, mustard, chloride of ethyl, chloroform, etc. Stretching of the nerve trunk as in sciatica (see NERVE STRETCHING, SCIATICA), excision of a part of the affected nerve, or removal of a ganglion of the sympathetic, may effect a cure. Permanent cure or temporary relief may be had from injection into or about the affected nerve or its ganglion of alcohol, normal saline solution, or cocaine. In all cases hygiene, diet, regimen, and tissue building are necessary, as well as the discovery and removal of any peripheral irritant, thereby stopping all nerve leaks. Refractive errors, decayed or impacted teeth, intranasal pressure, and accessory nasal sinus disease must always be sought for. See NEURITIS.

NEURALGIA, FACIAL. See FACIAL NEURALGIA.

NEURASTHENIA (Neo-Lat., from Gk. *νεῦρον*, *neuron*, nerve + *ἀσθένεια*, *astheneia*, weakness), nerve weakness. Perhaps the most frequent of the acquired neuroses. The symptom group making up this clinical entity was first familiarized by Beard of New York in 1869, and it is sometimes called the American disease, though now recognized as a world-wide malady. As a rule all forms of nervous energy are reduced and fatigue quickly appears upon the exercise of any motor, mental, or organic activity. It is essentially a disorder of the productive period of life, but does occur in neurotic children and in nervous adults of advanced years. The sexes are about equally affected. Hebrews, Scandinavians, and Slavs show a special susceptibility, and those of neuropathic heredity and the offspring of the physically defective are prone to be attacked by it.

Great altitudes, extremes of climatic conditions, wasting diseases, vicious habits, physical illness, injury, shock, and fright, or protracted anxiety, grief, worry, and excitement are competent causes. Excesses of all varieties and, finally and most important of all, overwork must be added to the list. The only essential element in the causation of neurasthenia is overstrain, and this is a quantity relative to the inherent capacities of the individual and often correlated with hereditary tendencies or defects.

The major symptoms of the disorder are headache, backache, gastrointestinal disturbances, neuromuscular weakness, mental depression, irritability, and insomnia. To these in varying number and of inconstant appearance are added tremor, twitchings, startings, sensations of general fatigue, pressure headaches, drawing feelings in the back of the neck and spine, tenderness at various points along the spine, particularly at its two extremities and at the waist, neuralgic pains, and various paræsthesiæ described as prickling, tightness, burning, numbness, stiffness, heat, cold, heaviness, soreness, and vague discomforts referred to the body viscera. Use of the eyes commonly intensifies the headache and causes prompt fatigue with increase in all the subjective complaints. Sometimes patients shun the light continuously. Nervous indigestion, gaseous fermentation, alternating diarrhoea and constipation, cardiac palpitation, feebleness of the circulation, and vascular storms are com-

monly presented. The activity of the functions of the genitourinary tract is reduced. On the mental side there is loss of concentration and consequently memory is enfeebled. Continuous application is impossible. Courage fails, introspection becomes habitual, and many apprehensions and distinct phobias of a hypochondriacal cast add to the patient's misery. The natural affections are diminished and depressed emotions are continuous. The sleep, disturbed by troubled dreams, is broken and unrefreshing. The early morning hours are particularly gloomy. The patient's general bodily condition is unsatisfactory. Anaemia and loss of flesh are commonly encountered, though exceptionally the general nutrition is excellent. The great majority of these symptoms it will be noticed are subjective, not demonstrable physically and capable of misrepresentation. For this reason such patients are misunderstood by their friends, who either foster the condition by misguided solicitude or give it scant sympathy. A careful examination proves that the nerve force is actually diminished and strength exhausted with undue ease. This is demonstrated by the contraction of the visual fields under appropriate tests, the initial exaggeration and progressive reduction of the tendon reflexes, the inability to maintain dynamographic records, the tendency to rapid heart, the digestive inadequacy, etc. Any one or even very many of the enumerated symptoms may be found in other ailments, but it is their systematic grouping and the exclusion of other definite morbid states that enables a diagnosis of neurasthenia to be made.

When the brain functions are principally disordered, the term "cerebral neurasthenia" is sometimes employed. In the same way spinal and sexual neurasthenia are mentioned, but in neurasthenia no function escapes, though there may be a varying preponderance of certain classes of symptoms. All functions are marked by an irritable weakness. Often this nervous disorder is associated with hysteria, particularly in the traumatic cases. Not seldom it is secondary to an initial bodily disease, which may or may not be present at the same time.

Neurasthenia is essentially chronic. Its causation is commonly of long standing, its onset insidious, its course protracted, its recession halting and marked by relapses, its tendency to recurrence pronounced. It is often associated with organic and inorganic diseases, and is encountered as an initial stage in the development of hypochondriasis, melancholia, mania, and general paresis. When uncomplicated by organic diseases, its prognosis is usually fairly good, provided the causal conditions can be removed and sufficient adequate rest and upbuilding secured. As it often arises out of the necessities of human existence and social conditions, its proper treatment is frequently impossible. The keynote is rest, and in proportion as this can be made complete both mentally and physically success results. The full rest-cure plan of Mitchell, especially with women, often secures brilliant results. In a modified form in mild cases it is also efficient. It implies the expenditure of much time and money. When this is not possible, change of scene, of occupation, of preëxisting influences, must otherwise be obtained. The burden of work, the fretting, and carking cares must be minimized, and the physical health and stamina raised to the highest possible level. If such patients can be fattened, success is almost

assured. Drugs play an entirely secondary part in the treatment of neurasthenia, merely meeting incidental physical requirements. Any underlying physical disease of which neurasthenia may be the superficial manifestation must of course receive major care. To the mental perturbation, however, constant attention must be directed. The patient's fears must be allayed, his hopefulness encouraged, his introspection diverted, and refreshing sleep secured. In proportion as the physician grasps the mental side of the disease, secures the patient's confidence, and meets the requirements of his biased views, is he successful and helpful in managing the neurosis.

A number of more or less speculative theories regarding the essence of neurasthenia are current, but nothing definite is known. Consult Church and Peterson, *Nervous and Mental Diseases* (8th ed., Philadelphia, 1914). See CLIMATE AND DISEASE.

NEUREUTHER, noi'roi-tër, EUGEN NAPOLEON (1806-82). A German painter, etcher, and illustrator, born in Munich, son and pupil of the painter Ludwig Neureuther (1775-1830). He also studied at the Munich Academy under Wilhelm von Kobell. His talent developed, however, chiefly under the influence of Cornelius, who employed him on the frescoes in the Glyptothek and in the Königsbau. His illustrations for Goethe's romances and ballads with marginal drawings, published in 1829-39, made his reputation. In 1830 Neureuther visited Paris, where his illustrations of the scenes of the July revolution appeared under the title "Souvenir du 27, 28, 29 juillet" (1831). After his return he published "Marginal Drawings to Bavarian Poets" (1832-35), and in 1838 completed his illustrations to Heide's *Cid*. His best etching, in which line he produced his most pleasing and valuable compositions, is perhaps the large plate of "Dornroschen" (1839). As a painter, he may be judged by "The Pastor's Daughter of Taubenhain," in the Pinakothek, Munich, and six canvases in the Schack Gallery at Munich. All his work is distinguished by great decorative charm and by purity and nobility of line.

NEURITIS (Neo-Lat., from Gk. *νεῦρον*, *neuron*, nerve). A disease of a nerve or nerves, accompanied by inflammation. Neuritis may be single or multiple, interstitial or diffuse, toxic or infective. It is caused by injury to the nerve involved by infection such as from typhoid fever, tuberculosis, or leprosy, or by the toxic action of alcohol, arsenic, lead, etc.

The symptoms of localized neuritis are severe pain, somewhat relieved when the part is at rest and kept warm, some numbness, reduction of the sense of touch, loss of power in the muscles, and eventual atrophy. There may be contraction of the muscles, with rosy color of the skin and a peculiar glossiness.

Multiple neuritis is very frequent. It is caused by the toxins of several infectious diseases, as diphtheria, typhoid fever, smallpox, and scarlet fever, as well as by mercury and lead, gout, diabetes, cancer, and tuberculosis, but most often by alcohol. In this form of neuritis the invasion is usually acute, with pain in head, back, and legs, loss of power in arms and legs so that the patient can scarcely climb the stairs, drop wrist and drop foot, muscular wasting, tenderness in the muscles, tremor, and sensory disturbances. Fever is rare, and the invasion of the disease is slow. When alcohol is the cause, delirium and

convulsions may occur, with hallucinations, somewhat resembling delirium tremens. Multiple neuritis is frequent in various countries, under various names. It is called kakké in Japan, and beriberi in China, New Zealand, India, Brazil, and the West Indies, in which countries it is endemic. Its course is similar to that of alcoholic multiple neuritis. Its mortality varies from 3 to 50 per cent. The mortality of alcoholic neuritis is not much smaller. Of those who continue the use of alcohol, 50 per cent die of alcoholism, pneumonia, or tuberculosis. Treatment is symptomatic, with removal of the cause. See BERIBERI.

NEUROGLIA. See NERVOUS SYSTEM AND BRAIN.

NEUROL'OGY (from Gk. *νεῦρον*, *neuron*, nerve + *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). The branch of science concerned with the anatomy, physiology, disorders, and diseases of the nervous system. Brain functions associated with mentality are somewhat arbitrarily placed in the field of psychology, and their disorders furnish the topics grouped under the head of psychiatry. Neurological conditions are also studied in the lower animals, giving a subdivision of the subject, comparative neurology, which with embryology furnishes important facts which aid in understanding the human nervous apparatus. In the more limited medical sense, neurology embraces a study of the human nervous system, its diseases (except insanities) and their treatment. See NERVOUS DISEASE.

NEUROMA, nû-i-ô'ma (from Gk. *νεῦρον*, *neuron*, nerve + *ωμα*). A tumor, composed chiefly of sympathetic ganglion cells (true neuroma) or of fibrous tissue (false neuroma). See TUMOR.

NEURON, nû'rôn (Gk. *νεῦρον*, *neuron*, nerve). See NERVOUS SYSTEM AND BRAIN.

NEUROPTERA (Neo-Lat. nom. pl. from Gk. *νεῦρον*, *neuron*, nerve + *πτερόν*, *pteron*, wing). A Linnaean order of insects which has recently been restricted by separating out the orders Mecoptera, Corrodentia, Isoptera, Odonata, Ephemera, Plecoptera, and Trichoptera, which together for a time were known as the Pseudoneuroptera. At present the Neuroptera include those forms belonging to the old group of net-winged insects which possess a complete metamorphosis. The mouth parts are formed for biting. The wings are four in number, membranous, and furnished with numerous veins, usually with many cross veins. Practically all forms are carnivorous and feed upon other insects. Some of them are aquatic, but the majority live on land and wherever their prey abounds. The order is divided into seven large families:

1 The Sialidæ, including the dobson or hellgramite fly (see CORYDALIS), the alder flies (*Sialis*), and the fish flies (*Chauliodes*).

2 The Raphidiidæ, or snake flies (q.v.).

3 The Mantispidæ, including the false scorpion, or mantis-like Neuroptera. These insects, rare in the United States, have a long neck and grasping front legs, and are predatory in habits. Their transformations are especially interesting.

4 The Conopterygidæ, including the dusty-wings, which are the smallest of the Neuroptera and have wings covered with whitish powder. They are very few in number, and prey, in the larval stage, upon scale insects, plant lice, and red spiders.

5 The Myrmeleionidæ, or ant lions (see ANT LION).

6 The Hemerobiidae, or aphid lions (see APHIS LION).

7. The Chrysopidae, or golden-eyed lace-winged flies. See LACEWING.

Nearly all the families of Neuropteran insects are represented by fossil remains in the Tertiary rocks, and some, such as the dragon flies, caddis flies, May flies, and white ants, appear in the still earlier Mesozoic formations.

Consult: David Sharp, *Cambridge Natural History*, vol. v (London, 1895); V L Kellogg, *The Insect Book* (New York, 1908); J. H. Comstock, *Manual for the Study of Insects* (8th ed., Ithaca, 1909); L. O. Howard, *The Insect Book* (New York, 1914).

NEUROPTERIS (Neo-Lat., from Gk. *νεῦρον*, *neuron*, nerve + *πτερίς*, *ptēris*, fern). An important genus of fossil ferns common in the coal-measure shales and sandstones of Carboniferous age in North America and Europe. See CARBONIFEROUS SYSTEM, FERN.

NEUROSIS (Neo-Lat., from Gk. *νεῦρον*, *neuron*, nerve) A morbid nervous state, either functional (due to reflex disturbance from a lesion or a condition in another part of the body) or organic (due to local conditions). Neuroses are classed as *kinesioneuroses*, or disorders of motion; *asthesioneuroses*, or sensory disorders; *trophoneuroses*, or disorders of nutrition, *thermonuroses*, or disorders of heat perception, *vasomotor neuroses* or *angioneuroses*, or disorders of circulation, *secretory neuroses*; and *mixed neuroses*. Among the latter are the *acronuroses*, certain disorders affecting the extremities, such as acroparesthesia and erythromelalgia; *sexual neuroses*, affecting the functions of the sexual organs; and *psychoneuroses*, in which there is a combination of mental and physical symptoms due to a complex condition. Many of these functional neuroses are considered under their proper titles.

The occupation neuroses are functional disorders consisting of numbness, tingling, partial loss of muscular power, involuntary contractions or spasms, tremor and disability, which combine to prevent the use of certain groups of muscles which have been used habitually by the patient in his occupation or professional labors. An occupation neurosis and atrophy is really a condition of muscle fatigue occurring in a neurasthenic, with subsequent neuritis in a few cases. The most common neurosis of this class is *writers' cramp*, or *scriveners' palsy*. This disease has been known since about 1820, when the steel pen superseded the quill. Worry, intemperance, and other undermining influences are predisposing causes, as well as preëxisting neurasthenia, as already noted. Excessive writing, under mental pressure, is the exciting cause, especially if the writing is done with the hand in a cramped position. It is a chronic disease. Many sufferers learn to write with the left hand, but this also may become affected. The use of gold pens has brought some relief and has controlled the increase of the affection among writers. But the great refuge and preventive is the typewriter, although this instrument itself may engender a neurosis. Those who write much should use large cork penholders and gold pens. Writing under cerebral strain should be avoided.

Telegraphers' cramp is common among the manipulators of the Morse instrument. About one in 200 operators suffer from "loss of the grip." The symptoms are much the same as in *writers' cramp*. Among the other occupation

neuroses are *musicians' cramp*, seen in pianists, violinists, flutists, and others; *sewing spasm*, among tailors, seamstresses, and shoemakers; *milkers' spasm*, which is very rare; *ballet-dancers' cramp*, and many others. The *glass arm* of the ball player and the *tennis elbow* are really forms of occupation neurosis.

In the treatment of occupation neuroses, rest or change of occupation, massage of nerve and muscle, electricity, douches, and the cautery have proved useful. Drugs are generally useless, except such as relieve the neurasthenia of the patient. Consult Church and Peterson, *Nervous and Mental Diseases* (8th ed., Philadelphia, 1914). See OCCUPATIONAL DISEASES.

NEUROTIC (Neo-Lat. *neuroticum*, from *neurosis*). A word partly synonymous with nervous, now commonly used to describe an individual who suffers from nervous disease, such as neurasthenia or hysteria, or who is of pronounced nervous temperament. The term "neurotic" was formerly used in medicine to specify such a drug as tends to affect principally and specifically the brain centres that govern intellect, sensibility, and motor activity. Alcohol, ether, chloral, opium, potassium bromide, amyl nitrite, and strychnine are examples of drugs to which this name may be applied.

NEURUPPIN, noi'rup-pen'. A town of the Province of Brandenburg, Prussia, on the small lake of Ruppín, connected with the Elbe, 36 miles northwest of Berlin (Map Prussia, E 2). It has a thirteenth-century church, a Gymnasium, and a seminary for teachers. Its industries are brewing, spinning, and the manufacture of linen and woolen cloths, starch, brushes, fire extinguishers, lithographed work, machinery, and lumber. There is also considerable trade in cattle and cereals. Neuruppin became a town in 1256. Pop., 1900, 17,100, 1910, 18,720.

NEUSALZ, noi-zalts'. A town in the Province of Silesia, Prussia, on the Oder, 75 miles northwest of Breslau (Map Prussia, F 3). The principal manufactures are linen thread (employing 2200 hands), cartons, machinery, lumber, cartridges, and enamel. It has iron mines and a shipbuilding trade. Pop., 1900, 12,586, 1910, 13,474.

NEU-SANDEC, noi-zan'dets. A town of the Crownland of Galicia, Austria, on the Dunajec, about 45 miles southeast of Cracow (Map Austria, G 2). It has a Roman Catholic church of the fifteenth century, an Evangelical church of the seventeenth century, an old castle, a new town hall, a Gymnasium, a girls' convent school, a Jesuit college, and a hospital. The chief industrial establishments are the extensive railway shops. Machinery and flour are produced, there are fisheries, and in the vicinity of the town petroleum wells. Pop., 1910, 25,404; (district) 136,366, mostly Poles and Jews.

NEUSATZ, noi'zats (Hung. *Újvidék*). A royal free town in the County of Bács-Bodrog, Hungary, situated on the left bank of the Danube, opposite the town of Peterwardein and at the mouth of the Franz-Josefs Canal, 163 miles south-southeast of Budapest (Map Hungary, F 4). It is a town of recent origin, having been practically rebuilt since its destruction in 1849. It is the seat of the Greek Oriental Bishop of Bács and has a new cathedral, a higher Gymnasium, an industrial and a commercial school. Its products include millstones, silk, preserves, and spirits, with good fruit, vegetables, and wines. The river trade is large. Neusatz is the

seat of the Matice Srpska, the chief literary and scientific organization of the Serbs in south Hungary. Pop., 1900, 29,296, 1910, 33,089, mostly Serbs and Magyars

NEUSE, nîs. A river of North Carolina, rising in Person County in the northern part of the State and flowing southeast into the west end of Pamlico Sound (Map: North Carolina, F 3). It is about 300 miles long and navigable for light-draft steamers for about 70 miles from its mouth. At Newbern, 34 miles from its mouth, it widens into a broad estuary. The stream is from $1\frac{3}{4}$ to 5 miles wide and has a channel depth of more than 13 feet for 25 miles above its mouth, for the next 9 miles (to Newbern) the channel depth is 11 feet.

NEUSIEDLER SEE, noi'zéd-lër zä (Hung. *Ferto-Tava*). A lake in northwest Hungary, 30 miles southeast of Vienna (Map: Hungary, E 3). It is about 23 miles long, from 4 to 9 miles wide, and covers an area of 126 square miles, but its surface is not permanent. On the east shore is the large swamp of Hanság, but the land on the west shore consists of vine-clad hills, with several thriving towns. The water is salty and unfit to drink. The lake has dried up on several occasions, notably in 1865, when farms were laid out in its bed, but in 1870 it filled up again, destroying all improvements. It is now connected with the Rábnitz River by a canal which, in case of a flood, drains off the surplus water.

NEUSOHL, noi'zól (Hung. *Besztercebánya*). The capital of the Province of Sohl, Hungary, at the confluence of the Gran and Bistritz, 75 miles north of Budapest (Map: Austria-Hungary, F 2). It has a cathedral noted for its fine fourteenth-century altar, other ecclesiastical structures, and an old castle, now used as barracks. There are manufactures of hardware, firearms, paper, cloth, matches, and spirits, and a silver foundry. Four and a half miles to the north are the Herrengrund silver, iron, and copper mines. Pop., 1910, about 12,000; (district) 33,268.

NEUSS, nois. A town in the Rhine Province, Prussia, near the Rhine, with which it is connected by a canal, 4 miles west of Düsseldorf (Map: Prussia, B 3). The Roman Catholic church of St. Quirinus, a beautiful edifice of the transition from the round to the pointed style, was begun in 1209. The late Gothic Rathaus is interesting for its collection of paintings by Janssen. Neuss produces a large amount of rape oil. There are manufactures of paper, machinery, ironware, screws, hats, soap, starch, oleomargarine, chicory, chemicals, bricks, lumber, meal, cravats, leather, and woollens, there is a trade in grain, cattle, and coal. Pop., 1900, 28,484; 1910, 37,224. The town is supposed to be the Novesium of the Romans. It came under the Archbishop of Cologne in 1074. In 1474 it suffered a long siege by Charles the Bold, and a century later was almost totally destroyed by Alexander of Parma.

NEUSSER, noi'sër, EDMUND VON (1852-1912). An Austrian physician. He was born in Swoszowie, Galicia, studied medicine in Vienna (M.D., 1877), was admitted as lecturer to the medical faculty of the University at Vienna in 1888, and was appointed professor of medicine and director of the second medical clinic in 1903; from this position he resigned in 1912. He made reports to the Austrian government on pellagra as observed in Friaul and Rumania

and described in *Die Pellagra in Oesterreich und Rumänien* (1887), and is the author, among other writings, of *Ausgewählte Kapitel der klinischen Symptomatologie* (1904) and *Clinical Treatises on the Symptomatology and Diagnosis of Disorders of Respiration and Circulation*, English translation by Andrew MacFarlane (New York, 1901-09). He wrote for Nothnagel's *Specielle Pathologie und Therapy*, "Die Erkrankungen der Nebennieren" (1897, English translation, "Diseases of the Suprarenal Capsules," in *Nothnagel's Practical Diseases of the Liver, etc.*, 1903).

NEUSTADT, noi'stat. A city in Upper Silesia, Prussia, on the river Prudnik, 20 miles southwest of Oppeln (Map: Prussia, G 3). It has two monasteries, a Gymnasium, and a school to teach the weaving of Persian rugs. There are manufactures of woollen and linen fabrics, damask, carpets, shoes, dyes, and yeast. Pop., 1900, 20,139, 1910, 18,856.

NEUSTADT, HEINRICH VON. See HEINRICH VON NEUSTADT.

NEUSTADT, WIENER. A town of Austria. See WIENER-NEUSTADT.

NEUSTADT-ON-THE-HARDT, hart. A town in the Rhine-Palatinate, Bavaria, situated in the Hardt Mountains, 14 miles west-northwest of Speyer (Map: Bavaria, D 4). The abbey church (1356) contains many tombs of the Counts Palatine. The educational institutions include a Gymnasium, a Realschule, a Latin school founded in 1579, and a vintner's school. Neustadt manufactures cloth, paper, tobacco, machinery, boilers, cement, starch, wire cloth, and furniture. In the vicinity are extensive vineyards, from which a good grade of sparkling wine is produced. Pop., 1900, 17,800, 1910, 19,288, chiefly Protestants.

NEUSTETTIN, noi'stët-tën'. A town in the Province of Pomerania, Prussia, 80 miles southwest of Danzig (Map: Prussia, G 2). There are manufactures of machinery, ironware, dyes, soap, and matches, and trade in grain and cattle. Pop., 1905, 10,785; 1910, 11,833.

NEUSTRELITZ, noi-strä'lîts. The capital of the Grand Duchy of Mecklenburg-Strelitz, Germany, 60 miles north by west of Berlin (Map: Germany, E 2). It is laid out with remarkable regularity, its wide, straight streets radiating in eight directions from the market place, which is adorned with a statue of the Grand Duke George. The principal buildings are the grand ducal palace, situated in a beautiful park and containing a fine library of 130,000 volumes and collections of coins and antiquities, the theatre, the royal stables built in Byzantine style, and the Rathaus. There are also a Gymnasium, a Realschule, and a fine hospital. The principal manufactures are machinery, stoves, woollens, lumber, cloth, vinegar, flour, conserves, and dairy products. Neustrelitz was built in 1726 on the site of the old fortress of Lunkin. Pop., 1900, 11,344, 1910, 11,993.

NEUSTRIA, nûs'tri-a (Lat. *Francia occidentalis*, west France). The name given in the times of the Merovingians to the western portion of the Frankish Empire, in contrast to Austrasia (qv). Later it was used for various territorial divisions; in the eleventh century and later it was often used as synonymous with Normandy. Consult Longnon, *Atlas historique de la France* (Paris, 1889). See FRANKS.

NEUTITSCHEN, noi'tîsh-in. A town in the Crownland of Moravia, Austria, on the

Titsch, 70 miles northeast of Brünn (Map. Austria, F 2) It has a Byzantine church and an old castle, a higher Realschule, and schools of agriculture, forestry, and textiles There are manufactures of tobacco, vehicles, organs, spirits, hats, and cloth Pop, 1910, about 15,000; (district) 85,245, chiefly of German descent. Near by is the sulphur bath of Sommerau.

NEUTRAL AXIS (Lat. *neutralis*, from *neuter*, neuter, from *ne-*, not + *uter*, either) An imaginary line of a body which is subjected to a transverse strain and is so situated as to separate the forces of extension from those of compression If the ratio of the resistance to extension and compression were the same for all substances and depended merely upon the form of the body, then in all bodies of the same shape the neutral axis would have a definite geometric position But this ratio has a separate value for every substance. In a rectangular wooden beam supported at both ends, the neutral axis passes longitudinally through the centre of the beam, while in cast iron, in which the resistance to compression is greater than that to extension, it is a little above the centre, and in wrought iron, in which the contrary is the case, it is a little below the centre

NEUTRAL IDIOM. See UNIVERSAL LANGUAGE.

NEUTRALITY. Neutrality is the situation of states which do not enter a war It is temporary when assumed with respect to a specific war, by virtue of a voluntary act; *perpetual* when it is assumed in advance for all wars to come, by virtue of a formal obligation The conception of neutrality is of relatively recent origin and as yet is only imperfectly developed

Temporary Neutrality. Temporary or optional neutrality is as old as war itself, but the recognition of a right of neutrality and the determination of the rights and duties of neutrals are recent A law of neutrality, amounting as it does to a limitation of belligerency, is only possible at a time in history when neutral nations become strong and numerous It was not till the eighteenth century (Vattel, 1758) that an attempt was made to present a complete theory of neutrality under that name Grotius in the seventeenth century suggested that neutrals should form an opinion upon the justice or injustice of the hostilities, and then he bade them "do nothing which would further the cause of the one in the wrong, or hamper the movements of the one in the right" However, in doubtful cases he demanded that neutrals should treat both parties equally. (*De Jure Belli ac Pacis*, book iii, chap xvii, 3, 7) According to Vattel, on the other hand, the neutral is not, on principle, to constitute himself a judge of the justice or injustice of the cause of the war. For the principle of unequal treatment of belligerents in accordance with the justice or injustice of the war is substituted the principle of impartiality, i.e., of equal treatment for both belligerent parties But there was an exception to that equality of treatment in cases where, by a treaty concluded before the war, the neutral had engaged to furnish assistance, either in subsidies or troops Regard for treaties thus limited the law of neutrality, which was the more imperfect in that it was not until somewhat later that it found its basic principle This basic principle is respect for neutral sovereignty To make war is an act of sovereignty, but the sovereignty of a state does

not extend beyond the limits of its jurisdiction The neutral, therefore, cannot be obliged to allow the belligerent to commit an act of war within its territory Not only should a belligerent never enter neutral territory, despite the numerous territorial violations of the seventeenth and eighteenth centuries, nor even follow an enemy ship into neutral waters, despite the contrary opinion of Bynkershoek (*Quaestiones Juris Publici*, book 1, chap viii, 1737), but by the end of the eighteenth century it had been settled that the fitting out of privateers and the adjudication of prizes, acts of belligerent sovereignty, could not be effected within the jurisdiction of a neutral without violating its sovereignty. The American Secretary of State, Jefferson, wrote to citizen Genet, Minister from France, that it is "the right of every nation to prohibit acts of sovereignty from being exercised by any other within its limits" Furthermore, the raising of troops and the granting of military commissions were sovereign rights which, as they pertained exclusively to the nation itself, could not be exercised within its territory by a foreign power without its consent. In June, 1794, the first Neutrality Act was passed, forbidding within the United States the acceptance and exercise of commissions, the enlistment of men, the fitting out and arming of vessels, and the setting on foot of military expeditions, in the service of any prince or state with which the government was at peace. (John Bassett Moore, *American Diplomacy*, 1905, pp 43-46.) In 1818 was passed the Foreign Enlistment Act, which, subsequently amended and developed, is still in force. It prohibits all citizens of the United States from serving in a war against a state with which the United States is at peace and forbids the equipping and arming, within the limits of American jurisdiction, of a vessel destined to be used as a cruiser in a war during which the United States remains neutral, or the increase or the armament of such a vessel in a port of the United States, or the organizing within the territory of the Republic or its waters of an expeditionary force directed against a country with which the United States is at peace. It is out of respect for its own sovereignty that a neutral state places limitations on the activity of belligerents and thus makes war recede before neutrality.

The moment that a neutral is conscious of its right to prevent a belligerent from using its territory for battle, for the passage of troops that would surely lead to battle, for the arming of vessels and the adjudication of maritime prizes, it is equally conscious that it ought to abstain from all acts which, in favoring one of the belligerents, would give the other a motive to enter its territory in order to put a stop to such acts. Reason requires that a neutral, in order to keep its sovereignty intact during the course of a war, shall refrain from taking part in the operations of that war. Accordingly a neutral is not permitted to give or sell arms or munitions drawn from the arsenals of the state or government manufactures, or condemned ships of the fleet, still less subsidies from the public funds; but it is not contrary to the obligations of neutrality for a state to permit its citizens, in the free exercise of industry and commerce, to manufacture for and sell to belligerents arms, munitions, and detached parts of vessels Neutrality is the duty of the state;

it is not the duty of the individual citizen. This distinction is clearly laid down in Conventions V and XIII of The Hague Conference of 1907: A neutral Power must not allow belligerents "to move troops or convoys of either munitions of war or supplies across" its "territory." Likewise a neutral Power must not allow belligerents to form corps of combatants, or recruiting agencies to be opened to assist the belligerents (Convention V, Arts. II, IV, V), or to establish a prize court on its territory or on a vessel in its waters, or to use its ports and waters as a base of naval operations against its adversaries, or to erect wireless telegraph stations or any apparatus for the purpose of communicating with the belligerent forces on land or sea, or to supply, in any manner, directly or indirectly, warships, ammunition, or war material (Convention XIII, Arts. IV, V, VI.) But, according to Article VII of Conventions V and XIII (same text for both Conventions), "A neutral Power is not bound to prevent the export or transit, for the use of either belligerent, of arms, munitions of war, or, in general, of anything which could be of use to an army or fleet." The principle, thus established, of the freedom of neutral commerce in military supplies in time of war, is, however, subject to one exception, viz., warships, the equipping, arming, and departure of which for the immediate purpose of cruising on the high seas for war or capture, must be prevented by neutral Powers by every means at their disposal. Such a military unit organized on neutral territory would transform that territory into a base of military operations, in disregard of the principle of territorial inviolability of a neutral state above set forth. The rule governing cases of this kind arose out of the controversy with Great Britain over the cases of the *Alabama* and other Confederate cruisers equipped in England during the American Civil War, and was embodied in the Treaty of Washington of May 8, 1871, and reproduced in Article VIII, Convention XIII, of Oct. 18, 1907, at The Hague. It seems obvious that this rule, framed to cover the case of complete naval units, designed for cruising immediately after leaving neutral waters, could not have any application to detached parts of submarines or even, according to the decision of the American Department of State, March, 1915, to hydro-aeroplanes.

After being based for upwards of 100 years upon the respect for sovereign territory, the legal aspect of neutrality tends, since the close of the nineteenth century, to find its basis elsewhere. This new viewpoint is that, war being contrary to international order, to the common interests of the peoples, which are becoming more and more unified, and to the general good of humanity, which will not permit that anywhere on the globe men shall be insensible to the sufferings of others, it is the right and duty of states not involved in an international controversy to use their efforts to prevent the outbreak of war; then, if hostilities commence, to multiply their efforts to restrict the war zone as much as possible and to hasten the end of the struggle. By virtue of this new conception, embodied in The Hague Conventions of 1899 and 1907, For the Pacific Settlement of International Disputes, Article 3, "Powers, strangers to the dispute, have the right to offer good offices or mediation even during the course of hostilities." "The exercise of this right can

never be regarded by either of the parties in dispute as an unfriendly act." But further, by virtue of the same idea it is not the duty of neutral states to circumscribe the area of war and lessen the force of hostilities by preventing their citizens from carrying on commerce in arms and munitions of war or from loaning money to belligerents, and by preventing the coaling and repairing of belligerent warships, even when closing, except on internment, the ports of neutrals to such vessels. The progress of the pacific idea gives more and more force to the principle that neutral states ought, not only by abstention but also by action, to deprive belligerents of any kind of assistance, direct or indirect, within the limits of their jurisdiction. In Conventions V and XIII of Oct. 18, 1907, at The Hague, the solution of these diverse questions has been left in a systematic manner to the discretion of the neutral state. To each individual state, out of the fullness of its sovereignty, it leaves the right to say whether it will prohibit the exportation or transportation to belligerents of arms and munitions of war; whether it will prohibit or restrain the use by belligerents of telegraph or telephone cables or wireless apparatus, whether belonging to companies or to individuals, whether a belligerent war vessel may stay in its ports more than 24 hours (Convention XIII of 1907, Art. XII), excepting in the case of a storm at sea; and each state may fix the maximum number of warships belonging to a belligerent which may be in one of the ports or roadsteads simultaneously. (Art. XV.) Finally, each state may allow warships to coal in its ports or waters, either directly or through dealers, in a quantity even more than sufficient to reach the nearest port in their own country. (Convention XIII of 1907, Art. XIX.) But if it does not prohibit the exportation of arms and munitions at the opening of hostilities, the neutral state cannot change the rule in the course of the struggle, "except in a case where experience has shown the necessity for such change for the protection of the rights of that Power." Further, if at the beginning of hostilities, and subject to the preceding exception, the neutral state has not passed legislation upon the length of stay, the number and restocking of belligerent vessels in neutral waters, Convention XIII of 1907 has supplied a course to be followed. In the absence of special provision to the contrary in the legislation of a neutral Power, belligerent warships are not permitted to remain in the ports, roadsteads, or territorial waters of the said Power for more than 24 hours, except in the cases covered by the present conventions. (Art. XII.) In the absence of special provisions to the contrary in the legislation of a neutral Power, the maximum number of warships belonging to a belligerent which may be in one of the ports or roadsteads of that Power simultaneously shall be three. On principle, belligerent warships may ship only sufficient fuel to enable them to reach the nearest port in their own country, but they may fill up their bunkers built to carry fuel when in neutral countries which have adopted this method of determining the amount of fuel to be supplied.

In the determination of the rights and duties of neutrals it is impossible not to reckon with the difficulties for neutrals which arise from obligations too numerous and too strict. It would

be imprudent to lay down such rules as a neutral could not make a belligerent respect. Not only should the duty of a neutral be limited in principle to abstention from all direct aid, or the prohibition of every act which would transform its territory into a base of operations, but, apart from the matter of direct aid, a neutral state can only be expected to use "due diligence," in accordance with the terms of the Treaty of Washington of May 8, 1871, in the affair of the Alabama claims, or, in accordance with the interpretation by Articles XVIII and XXV of Convention XIII of The Hague of Oct. 18, 1907, to exercise such surveillance as the means at its disposal permit. After having used all its efforts, even to a display of force, to prevent the violation of its neutrality, the neutral should do all in its power, once this violation has been committed, to put an end to its effects. When a ship has been captured in the territorial waters of a neutral Power, this Power must employ, if the prize is still within its jurisdiction, the means at its disposal to release the prize with its officers and crew and to intern the prize crew.

If the prize is not within the jurisdiction of the neutral Power, the captor government, on the demand of that Power, must liberate the prize with its officers and crew (Convention XIII of 1907, Art. III.) Finally, neutrals have the incontestable right to refuse the access of their ports and waters to warships which would violate their neutrality (Convention XIII of 1907, Art. IX.) More than that, in the event of an embargo on arms or the refusal of hospitality to belligerent warships, the neutral state assumes an authority over the Powers at war, which permits it to demand of them respect for its commerce in the measure which the legitimate necessities of war permit.

The belligerent whose war halts or menaces commerce profits by its command of the sea in so far as it succeeds in paralyzing rival traffic. As much for defending its commerce against the rivalry of neutrals as for preventing the enemy from sustaining or developing its economic forces, the belligerent has but one aim—to prohibit a neutral from all commerce with its adversary. The neutral resists. The greater it grows the stronger becomes its resistance and the more its commercial liberty extends. After having in the fourteenth century prohibited all neutral commerce with the enemy, belligerents now limit themselves to prohibiting trade in certain articles to some point of the enemy's coast or, on the other hand, to limiting the trade in all articles to a destination at certain designated points of the hostile coast. In the first instance the prohibition of commerce results in the listing of certain articles, called contraband of war, as forbidden to commerce. In the second case the prohibition results in the employment of naval force to cut off all trade with certain enemy ports. A belligerent may arbitrarily increase the list of articles in the catalogue of contraband of war and may announce a blockade without assembling a naval force sufficient to make it effective. Such a multiplication of lists of contraband and such fictitious, or "paper," blockades quickly draw protests from neutrals. These latter strive for two reforms—the limitation of contraband to articles immediately in demand for hostile purposes and the limitation of blockades to such as actually bring to bear a force sufficient to assure respect

for them. The rules governing blockades and contraband of war are the result of a compromise between the interest of the belligerent, which is to cut off neutral commerce, and the interest of the neutral, which is to continue it. To impose on neutrals the renunciation of all commerce with blockaded ports, the belligerent on his part must maintain a naval force sufficient to make it impossible for the neutral to engage in commerce with the blockaded ports without grave danger of capture; in other words, the blockade must be effective. To make neutrals renounce dealings with the whole hostile coast, the belligerent should give them the liberty of trading in certain articles designed for the noncombatant population, and even of certain other articles that could neither directly nor indirectly serve military purposes, and this without regard to their final destination. Briefly, then, the belligerent guarantees the prohibition of neutral commerce in absolute contraband (arms, munitions), as distinguished from relative or conditional contraband (food-stuffs, coal), the transport of which is prohibited only when destined for a military or naval base, for the contractor of an enemy state, or, more generally, for any branch of the administration of that state. The progress of the law of neutrality tends to limit the power of blockade by the substitution of real effectiveness for fictitious effectiveness, and to limit contraband by the curtailment of lists of conditional as well as of absolute contraband. At the same time, neutral commerce tends to remove neutral merchandise from the status of enemy private property under an enemy flag, by proclaiming neutral private property under an enemy flag to be exempt from seizure, and to favor neutral navigation by the adoption of the principle that the neutral flag covers enemy merchandise. Three great international acts mark in the commercial field the increasing recognition of neutral rights. By the Declaration of St. Petersburg, Feb. 26, 1780, inspired by the French Minister to Catharine of Russia, Vergennes, and directed by the northern courts against the maritime tyranny of Great Britain, contraband of war was reduced to arms and munitions, enemy private property was unseizable under a neutral flag, although neutral private property was seizable under an enemy flag, blockades were to be constituted by ships constantly on guard and reasonably close at hand. In virtue of the Declaration of Paris, April 16, 1856, the English rule that neutral private property is unseizable under a hostile flag is combined with the French rule that enemy private property is unseizable under a neutral flag; blockades had to be effective, i.e., of a kind that involved evident danger of entry and departure; but, unlike the provisions of the Declaration of 1780, which emanated from neutrals, those of 1856, which followed the Crimean War, emanated from belligerents. These latter reserved the right, in not defining contraband, of withdrawing the concession that had just been made to neutrals by Great Britain in ceasing to seize private enemy property under a neutral flag. France agreeing to refrain from seizing neutral private property under an enemy flag. The progress of the law of neutrality demanded imperiously the precise determination of what articles constituted contraband. In the light of the experience of the Russo-Japanese War, that necessity was, after a vain effort to

suppress contraband, satisfied under English initiative, by the Declaration of London, Feb. 28, 1909. By virtue of this declaration, signed by the Great Powers and by Spain and Holland, but not yet ratified and hence without force in the Great War which began in 1914, blockades had to be effective; absolute contraband of war became limited to arms, munitions, and objects of immediate use in war; objects which could serve peace as well as war (foodstuffs, combustibles, etc.), constitute together with absolute contraband a relative contraband whose transportation is not forbidden unless they are destined to combatants, finally, certain articles such as cotton are declared as never to figure on contraband lists, whether relative or absolute.

The doctrine of continuous voyage which permits delaying merchandise, when merchandise has a destination from an unprohibited port to an ulterior destination at a prohibited port (blockaded or neutral), is not to apply in future in the case of blockades, and, maintained in the case of absolute contraband, does not extend to relative contraband unless the neutral port affords access by sea to a state (e.g., Abyssinia or the Transvaal) devoid of sea-coast.

The destruction of neutral prizes admitted by France but repudiated by England and the United States was accepted as permissible only in cases of proved necessity. The convoy of neutral merchant ships by warships of their own nationality protects them from the right of visit and search by enemy cruisers. Like the prior Declaration of Paris of 1856, the Declaration of London is indivisible, i.e., is not open to acceptance in one part and rejection in another. Not originally signed by Spain and Mexico, who were to repair that omission in 1907, the Declaration of Paris was never signed by the United States, which was unable to accept its essential principle, the abolition of privateering, unless enemy private property should be declared unseizable under an enemy flag. But the principles of this declaration have been constantly followed, in what concerns blockade and the unseizability of enemy private property under a neutral flag, by the United States, which sees in these rules customary principles of positive international law.

Perpetual Neutrality. A state perpetually neutral renounces the right of making war and, in consequence, the right of contracting alliances, even purely defensive, because these would lead to war through the duty of sustaining an ally, or, if the ally did not demand aid, would place such neutral state in a situation of political dependence which would put it in danger of annexation. While a state perpetually neutral loses with the right of offensive war the right of annexing territory by force, it acquires, as regards other states, the right of never having to submit to war or annexation. Meanwhile such a state has the right, and may be under an obligation, to defend its neutrality if attacked.

Perpetual neutrality made its first entry into history in 1815 by the neutralization of Switzerland; it developed in 1831 by the neutralization of Belgium; then, in 1867, of Luxembourg; and finally, in 1885, of the Congo Free State. While the neutrality of Switzerland was in accordance with the historic aspirations of the Swiss people, that of Belgium in 1831 was rather in the in-

terest of Europe and its desire to oppose a barrier to the French longing for expansion and conquest, than in accordance with the will of Belgium; Belgium detached from the great Kingdom of the Netherlands seemed to Europe too frail a barrier; it was necessary to strengthen it. Against her inclination she submitted to an enforced and permanent neutrality as the price of her independence. By the Treaty of London, March 11, 1867, Luxembourg was in like manner neutralized. These three instances of permanent neutrality, differing in historical origin, could not have exactly the same juridical status. Belgium was prevented, in 1842, by the opposition of Great Britain from concluding a customs union with France, for a customs union, usually only a preliminary to a political union, seems incompatible with neutrality. On the other hand, in 1867, Luxembourg remained in the German customs union (the Zollverein). Belgium, like Switzerland, could have arms and fortresses, Luxembourg could have neither. Prussia, which kept a garrison there in the name of the North German Confederation, had to withdraw her soldiers, and the fortifications of the capital had, by virtue of the treaty, to be demolished.

These three neutralities, imposed in the interest of those neutralized, but still more in the interest of European peace and equilibrium, spring from conventions to which they owe their strictly obligatory character. The neutralization of the Congo Free State was otherwise accomplished—under the authority given by the Act of Berlin of Feb. 26, 1885, to the Conventional Powers of the Congo Basin, which permitted the Congo Free State to place itself under a régime of neutrality. While the neutrality of Switzerland, of Belgium, and of Luxembourg is an obligatory neutrality, from which the neutralized state cannot free itself without the consent of the signatories of the neutrality treaty, the neutrality of the Congo is a facultative neutrality, springing from a unilateral declaration of its King, which could at the present hour be withdrawn, had not Belgium been substituted, in 1908, for Leopold II in the sovereignty of the Congo Free State; for Belgium as a perpetually neutral state could not retract the declaration of neutrality of a Belgium colony. The neutrality of the Congo, being thus, owing to its different origins, a facultative neutrality, is not, like that of the other states just mentioned, a guaranteed neutrality.

Convention V of The Hague Conference of 1907, in fixing the rights and duties of temporary neutrality, determined also the juridical content of perpetual neutrality. The inviolability of neutral territory does not permit belligerents to send troops or convoys of munitions of war through the territory of a neutral state. And, in virtue of the same convention (Art. X), "The fact of a neutral Power resisting, even by force, attempts to violate its neutrality cannot be regarded as a hostile act." Cf. "Neutrality of Belgium," in *North American Review* (New York, December, 1914), and E. Waxweiler, *La Belgique neutre et loyal* (Lausanne, 1915).

Respect for the Law of Neutrals. Respect for the law of neutrality can be assured in but two ways: for temporary neutrality, through the joint action of neutral Powers leagued for the defense of their rights; and, for permanent neutrality, through increasing the number of

guarantees of neutrality. Can a neutral protest against the lapse of another neutral from the law of neutrality? France in 1861, on the occurrence of the *Trent* affair between the United States and Great Britain, believed it her duty to address to the United States friendly representations with regard to maintaining "certain principles essential to the security of neutrals." That example might have been remembered, under certain circumstances of some 50 years later, with a view to showing that neutrals have the right, and perhaps the duty, of recalling belligerents to a respect for the laws of neutrality. However, the experience of the Great War would seem to show that truly to assure respect for European neutralities, such neutralities must have guarantees extending from Europe even to America. Without such a world-wide guarantee perpetual neutrality is doomed. See BLOCKADE, CONTRABAND OF WAR, DECLARATION OF PARIS, INTERNATIONAL LAW; LONDON, DECLARATION OF

Sherman, "Permanent Neutrality Treaties," in *Yale Law Journal*, vol. xxiv (New Haven, 1915).

NEUTRALITY, ARMED. See ARMED NEUTRALITY.

NEUTRALIZATION. See NEUTRALITY.

NEUTRAL NATION. An Iroquoian tribe formerly holding the territory along the north

shore of Lake Erie in the Province of Ontario, and extending eastward as far as the Genesee River in New York. Their proper name is unknown. They were known to the Huron (see WYANDOT) as *Aiwendaron*, implying a people speaking a language slightly different (from Huron), and to the Seneca as *Gagwage-ono*. The French called them the Neutral Nation on account of their taking a neutral stand during the long wars between the Iroquois and the Huron. This did not save them, however, for on the final conquest and dispersion of the Huron people the Iroquois invaded the Neutral country, with the result that in 1651 the tribe was utterly destroyed, the remnant being incorporated with the conquerors or dispersed in small parties among the Western or Southern tribes. The final battle occurred at a fortified Neutral town about 6 miles south of the present Buffalo. See IROQUOIAN STOCK.

NEUTRALS. See NEUTRALITY.

NEUVILLE, nēvél', ALPHONSE DE (1836-85). A French military painter and illustrator. He was born at Saint-Omer (Pas-de-Calais), May 31, 1836, and died in Paris, May 20, 1885. His father, who was wealthy, wished his son to study law in preparation for an official position, but the boy, after attending the naval school at Lorient, and studying law for three years, determined to become a military painter. He went to Paris and took a studio of his own, studying a short time with Picot, but was more influenced by the art of Horace Vernet, Charlet, and Raffet. His first exhibited picture, "Batterie Gervais, Malakof" (1858), an episode from the Crimean War, achieved some success. Not being equally successful with later works, as a means of livelihood De Neuville designed a large number of illustrations for periodicals and books, including Guizot's *Histoire de France* and Claretie's *Histoire du drapeau*. His great success came after the Franco-Prussian War of 1870-71, in which he served as an officer of engineers. He became the most popular painter of that war, his pictures being greeted with great applause. From a purely artistic point of view they are open to criticism. His colors are sometimes dull and ill chosen, indeed, his drawings in black and white are more uniformly good than his paintings. He excels in portraying vividly and vigorously an intensely dramatic incident, and depicts soldiers in the thick of the fight with an accuracy and a sentiment that make the pictures national in spirit. As a draftsman, he is best known by his "Types of French Soldiers," published by Goupil & Co.

His early paintings include: "Capture of Naples by Garibaldi" (1860), "Chasseurs of the Guard" (1861), and "Attack in the Streets at Magenta" (1864), all in the Saint-Omer Museum. "Chasseurs Crossing the Tchernaiia" (1868), Lille Museum. Among his later and more famous pictures, many of which are in the United States, are "Bivouac before Le Bourget" (1872), Dijon Museum; "The Last Cartridge" (1873), "The Cemetery of St. Privat" (1880, Luxembourg), "Le Bourget" (1879) and "The Drummer," both in the Metropolitan Museum, New York; "The Adieu," bought by John Jacob Astor, New York; "Attack at Dawn," "In the Trenches," and "Information," all three in the Walters Gallery, Baltimore; "The Destruction of the Telegraph Line" (1884), David C. Lyall, New York. In 1881 De Neuville, in company with Detaille (q.v.), painted the celebrated cir-

cular panorama, "The Battle of Champaign," which was followed by that of "Rezonville." Consult De Lostalot, in *Gazette des Beaux-Arts*, vol. xxxii (Paris, 1885).

NEUVILLE, JEAN GUILLAUME, BARON ILYDE DE (1776-1857). A French statesman, born at La Charité-sur-Loire. He displayed great loyalty to Louis XVI and Marie Antoinette, was one of the most active agents in the "emigration" from France, took part in the Royalist uprising of 1796, and after the 18th Brumaire attempted to persuade Bonaparte to recall the Bourbons. Being accused of having taken a part in the plot of the "infernal machine," he fled to Switzerland, and later went to the United States. Upon the restoration of the Bourbons, he returned to France, was Minister to the United States from 1816 to 1821, and was then Minister to Portugal. He was a member of the Chamber of Deputies from 1822 to 1830, and held the portfolio of the Marine in the ministry of Martignac. After the revolution of July, 1830, he withdrew into private life. His *Mémoires et souvenirs* were published in 1888.

NEUWIED, noivét. A town in the Rhine Province, Prussia, on the right bank of the Rhine, 7 miles northwest of Coblenz (Map-Prussia, B 3). The castle, residence of the Prince of Wied, stands in a beautiful park and has collections of Roman antiquities. Educational institutions include a Gymnasium and two seminaries for teachers. Sheet tin and iron are the main products, but bridge material, enamel, buttons, brushes, wool and cotton goods, soap, tobacco, starch, and chicory are also manufactured. Pop., 1900, 11,003, 1910, 19,104. Neuwied was founded in 1662 by the Prince of Wied, as a refuge for religious exiles, and many religious denominations are represented.

NEVA, né'vâ, *Russ* pron. nyé-vâ'. The outlet of Lake Ladoga (q.v.) in northwest Russia. It leaves the lake at its southwest end and flows westward for 45 miles, emptying through several mouths into the Gulf of Finland. The city of St. Petersburg is built on the islands of its delta, 9 miles from its mouth. It is the last link in the great waterway which through the Volga River and the Ladoga Canal system connects the Caspian Sea with the Baltic. Though the volume of water flowing through the Neva is very great, and the river is in places more than half a mile wide, sand banks prevent a passage, and its navigation has been made possible only by extensive engineering works, and an artificial channel, running through the shallow Bay of Neva, connects its mouth with the harbor of Kronstadt. During continued west winds the waters of the bay are piled up in the delta of the river, causing destructive inundations.

NEVADA, né-vâ'dâ (Sp., signifying 'snow clad' or 'snowy land' and referring to the snow-covered mountains along the western border of the State). One of the Pacific coast group of the United States, popularly known as the Sagebrush State. It is separated from Oregon and Idaho on the north by the 42nd parallel of north latitude; from Utah and Arizona on the east by the 37th meridian west of Washington (long. 114° 1' 34" W.) and the Colorado River; and from California on the west and southwest by a line from the intersection of the 35th parallel and the Colorado River to the intersection of the 39th parallel and the 120th

meridian west of Greenwich, and continuing along this meridian to the 42nd parallel. Nevada ranks sixth in area among the States of the Union and has an extreme length from north to south of 483 miles and an extreme breadth of 320 miles. Its area is 110,690 square miles, of which 869 square miles consist of water.

Topography. Nevada lies almost wholly within the Great Basin, a large area of interior drainage chiefly included between the Sierra Nevada and the Wasatch Mountains. In Nevada numerous mountain ranges from 7000 to 10,000 feet in height and up to 100 miles in length divide the State into a series of elongated parallel valleys running north and south. The valleys are filled to a depth of several hundred feet with the detritus washed from the mountains, and their level floors are from 4000 to 6000 feet above sea level. Most of the valleys are separated from each other by low divides, and with the exception of the Humboldt valley the State is divided into a large number of isolated basins by the mountain ranges. About half of the total area is included in the more level land of the valleys. The highest point in Nevada is Mount Wheeler (elevation 13,058 feet), near the centre of the eastern boundary, while the lowest point is in the Cañon of the Colorado, in the extreme southern point of the State, with an elevation of less than 700 feet.

Hydrography. Since the surface of Nevada is a series of basins surrounded by mountains and low divides, a very small part of it drains to the ocean. A few of the tributaries of the Snake River rise in the extreme northeastern corner and finally reach the Pacific Ocean through the Columbia River, and a portion of the extreme southern part drains into the Colorado River. Over the greater part of Nevada the streams flow only during the wet season, and their waters either are lost in the alluvium of the valleys or evaporate from the transient lakes formed on the level floors, leaving in the dry season hardened mud flats the lower portion of which is frequently covered with a dazzling white coating of salts. In the northern half of Nevada the slow melting of the snow on the mountains maintains more permanent streams. The Humboldt River is the largest of these and flows from east to west across the State into the Humboldt and Carson sinks, where the water evaporates. Several rivers rise in the Sierra Nevada and flow into lakes and sinks in the west-central part. The chief of these are the Walker River, flowing into Walker Lake; the Carson River, flowing into the Carson Sink; and the Truckee River, flowing into Pyramid and Winnemucca lakes. Pyramid Lake is the largest body of water in Nevada and has a length of 31 miles, a breadth of 7 to 11 miles, and a depth of 380 feet. As none of the lakes have outlets, the water is brackish, containing about one-tenth as much salt as the ocean.

Climate. The dominant features of the climate are the low relative humidity and the large daily range in temperature. The rapid radiation, due to the dry air, cloudless skies, and high altitude, makes the nights cool even after the hottest summer days, and during the winter the temperature usually rises above freezing, even though it was below zero during the night. The average annual temperature is 49.6°, with a difference of six degrees between the northern and southern parts. About one

day in nine has a precipitation of .01 of an inch or more, and the rainfall is chiefly during the winter months. The average annual rainfall is 10 inches and is greatest on the mountains. Stations having different elevations may show a great difference in rainfall, even though a distance of but a few miles separates them. The dry, invigorating air and abundant sunshine make the climate of Nevada very pleasant and healthful.

Geology. East of a central north-and-south line the mountains are chiefly composed of Paleozoic sediments, while west of the line rocks of Mesozoic age are predominant. Throughout the State the lower elevations are remnants of volcanic flows of rhyolite, andesite, and basalts, together with lake sediments of Tertiary age. The valleys are deeply filled with detritus washed in from the surrounding mountains during the late Tertiary and Quaternary. Two periods of mountain building are recognized—the one at the close of the Mesozoic, which was accompanied by the intrusion of granites and diorites and which folded the rocks of pre-Cretaceous age; and the other which gave us the present mountains through the faulting of the crust into great tilted blocks at the close of the Tertiary. The ore deposits were formed at the time of the intrusion of the granites at the close of the Mesozoic and during the period of volcanic flows in the early Tertiary.

Mining. Though Nevada is essentially a metal-producing State, its importance as such is relatively smaller than during the days of the Comstock Lode (qv). This lode was developed in 1860, proving immensely rich in gold and silver. Between this year and 1890 its total production was \$340,000,000, the year of the greatest output being 1877, when the production was valued at \$38,000,000. After 1890 the output declined, the lode becoming apparently exhausted. This affected the industry, which decreased in importance until the remarkable discoveries, in 1906 and the years following, at Tonopah, Goldfield, and other places, when the State again became one of the leaders in the production of gold, silver, and copper. Copper, the most valuable product of the mines, did not assume importance until 1908, although it had been produced since 1873. Nevada, in 1913, ranked fifth among the States in the production of this metal. In that year the copper produced amounted to 90,693,751 pounds, valued at \$14,057,531.

Nevada ranked in 1914 first among the States in the production of silver and fourth in that of gold. The production of silver in 1913 amounted to 16,090,088 fine ounces, valued at \$9,718,410. In 1914 the value of the product was \$9,457,100. In 1913 there were produced 570,589 fine ounces of gold, valued at \$11,795,130. In 1914 the gold product was \$11,977,400. Lead and zinc are the only other metals produced in considerable quantities. The lead produced in 1913 amounted to 8172 short tons, and was valued at \$719,137. The production of zinc was 7210 short tons, valued at \$807,502. In addition to the metals mentioned, other minerals produced are clay products, lignite coal, occasional gems, graphite, gypsum, infusorial earth, iron ore, lime, mineral waters, quicksilver, salt, sand, gravel, stone, sulphur, and tungsten. The total production of minerals in 1913 was valued at \$37,842,084.

Agriculture. Of a total land area of ap-

proximately 70,285,440 acres, there were, in 1910, 2,714,757 acres, or 3.9 per cent, in farms, and in several counties in the southeast this percentage was less than one. The improved land in farms amounted to 752,117 acres. The average size per farm in 1910 was 1009 acres. The total value of property, including land, buildings, implements and machinery, domestic animals, poultry, and bees, was \$60,399,365.

One of the unusual characteristics of Nevada is the great area of arid land utilized, if at all, for grazing purposes only, upon which there are some very large farms or ranches, from 50,000 to 100,000 acres in extent.

Of the total number of farms in 1910, 2356 were operated by owners and managers and 333 by tenants. The foreign-born white farmers, in 1910, numbered 867, and the negro and other nonwhites 161. Of nonwhites, 148 were Indians, the rest Chinese and negroes.

The following table gives the acreage, production, and value of important crops as estimated for 1914 by the United States Department of Agriculture.

CROPS	Acreage	Prod in bus	Value
Wheat	45,000	1,322,000	\$1,266,000
Oats	13,000	676,000	372,000
Barley	13,000	611,000	397,000
Potatoes	12,000	1,560,000	1,092,000
Hay	247,000	*803,000	6,665,000

* Tons

Hay and forage is by far the leading crop, and in 1909 had an acreage of 350,538. The production was 521,918 tons, valued at \$4,185,071. Potatoes, the next important crop, had an acreage of 4864 in that year, and a production of 766,826 bushels, valued at \$396,652. There were produced in that year 396,075 bushels of wheat, valued at \$396,285. The acreage was 14,260. In that year there were also harvested 412,149 bushels of barley and 334,973 bushels of oats. The production of barley was valued at \$310,394, that of oats at \$191,968, and the acreage devoted to each was 12,200 and 7853 respectively.

The total value of crops in 1909 was \$5,924,000 and their combined acreage 392,387. The total acreage of potatoes and other vegetables was 6882 and their value \$661,803. Excluding potatoes, sweet potatoes, and yams, the acreage of vegetables was 1952 and their value \$264,000. The production of orchard fruits in 1909 amounted to 86,576 bushels, valued at \$82,695, of which apples composed 74,449 bushels, valued at \$66,097. The most important of the small fruits were raspberries, loganberries, gooseberries, and strawberries.

Live Stock and Dairy Products. Grazing is the most important of the agricultural industries. The domestic animals on the farms in 1910 were valued at \$19,071,809. On Jan. 1, 1915, the estimated number of cattle other than milch cows was 450,000, valued at \$18,315,000; milch cows numbered 24,000, with a value of \$1,860,000; horses, 78,000, valued at \$5,382,000; mules, 3000, valued at \$237,000; sheep, 1,532,000, valued at \$7,507,000; swine, 36,000, valued at \$418,000. The total number of fowls of all kinds in 1910 was 133,217, valued at \$93,668; the total value of milk, cream, and butter fat sold and butter and cheese made,

\$518,179, milk sold, 1,192,833 gallons, valued at \$219,554; and the butter made, 403,885 pounds, valued at \$121,649

Irrigation. Nevada is the most arid State in the Union. Of the 2689 farms in 1910, 2400, or 89.5 per cent, were irrigated. The acreage irrigated was 701,833 acres, or 93.3 per cent of the improved land in farms. The total length of irrigation ditches completed was 3151 miles. The irrigation plants existing in 1910 were capable of supplying water to 840,962 acres, and the total acreage included in projects completed or under way in 1910 was 1,232,142 acres. The estimated final cost of all enterprises in 1910 was \$12,188,756. The most important of the projects undertaken by the United States government is the famous Truckee-Carson project, in which in 1913 there was a net investment of \$5,029,519. This project has redeemed over 200,000 acres of land. See GREAT AMERICAN DESERT.

Manufactures. Nevada is the least important of the States as regards manufactures. The following table gives the most important data relative to manufactures for 1909 and 1904.

there were 10 national banks with a combined capital of \$1,410,000; surplus, \$306,000; deposits, \$5,743,000; cash, etc., \$663,000; loans, \$5,100,000. On June 30, 1914, there were 19 State banks with a capital of \$1,473,800; surplus, \$388,003, cash, etc., \$672,221, loans, \$3,945,381.

Government. The constitution, adopted in 1864, has been amended in important respects. Amendments may be proposed by either the Senate or Assembly, but must be agreed to by a majority of both Houses of two succeeding Legislatures before being submitted to the people, and if approved by a majority of the voters, become part of the constitution.

Legislative.—The Legislature, consisting of the Senate and an Assembly, meets biennially, the sessions beginning on the third Monday in January next following the election of the members of the Assembly. Senators hold office for four years, the members of the Assembly for two. The initiative and referendum have been adopted and are in full force.

Executive.—The supreme executive power is vested in the Governor, who must have attained

SUMMARY FOR 1909 AND 1904

THE STATE — LEADING INDUSTRIES

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY		Capital	Wages	Value of products	Value added by manufacture
			Total	Wage earners (average number)				
			Expressed in thousands					
All industries	1909 1904	177 115	2,650 1,016	2,257 802	\$9,807 2,892	\$1,982 693	\$11,887 3,066	\$3,521 1,468
Bread and other bakery products	1909 1904	29 11	86 48	17 31	147 39	54 28	356 127	142 63
Butter, cheese, and condensed milk	1909 1904	9 4	25 11	16 10	102 57	15 9	15 197	37 36
Cars and general shop construction and repairs by steam-railroad companies	1909 1904	9 6	857 340	818 315	607 251	610 280	1,033 532	696 310
Flour-mill and gristmill products	1909 1904	8 9	39 31	24 17	592 411	24 16	598 521	102 89
Lumber and timber products	1909 1904	9 5	224 162	186 147	774 1,072	143 110	503 528	215 271
Printing and publishing	1909 1904	54 29	276 121	180 67	654 168	193 64	519 253	406 220
All other industries	1909 1904	59 51	1,143 303	986 215	6,931 894	943 186	8,552 938	1,923 479

Of the total number of wage earners in 1909, 26 were women. The wage earners of 16 years of age and under numbered only 9.

Transportation. Two railroads cross the northern half from east to west, and several lines traverse the southern part. The total mileage in 1914 was 2412. The chief roads and their mileage follow: Central Pacific, 746 (operated by the Southern Pacific), Western Pacific, 427; San Pedro, Los Angeles, and Salt Lake, 267; Las Vegas and Tonopah, 200; Nevada Northern, 165; Tonopah and Goldfield, 110. The water transportation is negligible.

Banks. A national bank was organized in 1866, but soon closed. The First National Bank of Winnemucca, organized in 1886, was the only national bank in 1900. On Sept. 12, 1914,

the age of 25 years. The other executive officers are Lieutenant Governor, Secretary of State, Treasurer, Comptroller, Inspector of Mines, Superintendent of Public Instruction, Surveyor-General, and Attorney-General. The Governor, Secretary of State, and Attorney-General constitute a Board of State Prison Commissioners and a Board of Examiners with power to examine all claims against the State.

Judiciary.—The judicial power is vested in a supreme court, district courts, and justices of the peace. The supreme court consists of a Chief Justice and two associate justices, who are elected and hold office for a term of six years. The State is divided into nine judicial districts, for each of which a district judge is elected for four years.

Suffrage and Elections.—Every male or female citizen of the United States of the age of 21 years and upward, who has resided in the State six months, and in the district or county 30 days, next preceding any election, is entitled to vote. Voters are required to pay an annual poll tax, to be expended for the maintenance and betterment of public roads. Every public officer in the State is subject to recall from office by the qualified electors of the State or the county, district, or municipality from which he is elected. General elections are held on the Tuesday next after the first Monday of November, beginning with 1916 and every two years thereafter. There are severe penalties for bribery, intimidation, or other crimes against the electorate.

Statutory and Miscellaneous Provisions.—There are a Tax Commission and a Bureau of Industry, Agriculture, and Irrigation. An eight-hour-day law applicable to plaster and cement work is in force. A workman's compensation law has been adopted. There are also a juvenile court, a child labor law, and a compulsory-education law. The State has a food and drugs act and a law forbidding faro and other forms of gambling. A corrupt-practices act limits the campaign expenses to 20 per cent of one year's salary.

Finances. On admission to statehood, in 1864, Nevada had a public debt of \$400,000 (offset by State and Government bonds held in excess of this total), which in the following decade grew to \$733,528. This debt was in 9 and 10 per cent bonds, the prevailing rate of interest at that time. The income was derived partly from a tax on property, partly from a special tax on the proceeds of the silver mines. The income from this special tax grew rapidly with the output of the mines, in 1874 it amounted to 28 per cent of the total receipts of the State treasury, and in 1878 to 50 per cent, or about \$250,000. The output of the mines rapidly declined in the eighties, and with it the income from this source. The funded debt on Dec. 31, 1912, was \$614,000. It consisted of \$234,000 in bonds and \$380,000 in nonnegotiable certificates of indebtedness. All of this indebtedness is due to the State school fund, to which the annual interest is paid. The State also holds in trust for its educational fund bonds of other States or counties amounting to \$1,765,000, the interest being paid into this fund. The floating debt, consisting entirely of outstanding warrants, amounted to \$56,759. There was in the same year a sinking fund of \$63,064. The total per capita debt was \$670. The bonded debt at the end of the fiscal year 1913 was \$680,000. At the beginning of the fiscal year 1914 there was a balance in the treasury of \$449,404. The receipts for the year amounted to \$881,538, and the disbursements to \$1,073,114, leaving a balance on hand of \$257,828.

Population. Nevada is the most sparsely settled State of the Union. The following are the figures by decades: 1860, 6857; 1870, 42,491; 1880, 62,266; 1890, 47,355; 1900, 42,335; 1910, 81,875. The estimated population in 1914 was 98,726. The population per square mile in 1910 was 0.7, and the urban population (places of 2500 or more), 13,367. The native white population in 1910 numbered 56,277; the foreign-born whites, 17,999; Indians, 5240; Chinese, 927; Japanese, 864; and negroes, 513. The greater part of the foreign-born population

came from Italy. The males in 1910 numbered 52,551, the females 29,324, the males of voting age 40,026, the males of militia age 29,383. The only city with a population of 8000 or more in 1910 was Reno, with 10,867 in that year and an estimated population in 1914 of 13,579. The other cities with their populations in 1910 are as follows: Virginia City, 2244; Carson City, the capital, 2456; Tonopah, 3900; Goldfield, 4838; Ely, 2055.

Education. The chief educational problem of Nevada is the proper administration of a school system covering a wide and thinly populated area. Of a total school population of 16,132, in 1910, 10,141 attended school. There were in the same year 4702 illiterates of 10 years of age or over—67 per cent of the entire population. According to the Superintendent of Public Instruction the children of school age in 1910 numbered 13,523, the total school enrollment was 11,710, the average daily attendance 8552. There were 327 elementary schools, 21 district high schools, and 14 county high schools. Teachers numbered 576, of whom 480 were females and 96 males. The average monthly salary paid to male teachers was \$96.81, to female teachers \$81.85. The school fund, coming largely from the sale of public lands, amounted in January, 1914, to \$2,471,771. The total expenditure from the county funds for the year ending June, 1914, was \$659,659.

Manual training was conducted in 1914 in six high schools and nine elementary schools, and some form of industrial art has been introduced into 50 or more rural schools. Agriculture is taught in several high schools and in a few elementary schools. Teachers' institutes are held each year in each of the districts, and a State institution in one of the larger cities. County normal schools are situated at Eureka, Yerington, and Tonopah. The State University at Reno is the only institution of collegiate rank. Virginia City Mining School is at Virginia City. There are several schools where industrial training is given to the Indian students.

Charities and Corrections. The charitable and correction institutions include the Hospital for Mental Diseases at Reno, the Orphans Home and the State Prison at Carson City, and the Nevada School for Industry at Elko. The Crittenton Home for Girls at Reno receives aid from the State, but is not under State control. Convicts in the State prison may be detailed for work on roads, and for each month of such service may be allowed 10 days' extra time off and 25 cents for each working day. The deaf, blind, and feeble-minded are for the most part placed in institutions in California. The training of male juvenile delinquents is carried on at the Nevada School of Industry opened June 15, 1915, while the female juvenile delinquents are sent to institutions of adjoining States.

Religion. The Roman Catholics, including over 20 per cent of the total population, are more than three times as numerous as all of the Protestant bodies combined. The more important Protestant bodies are the Episcopal, the Methodist, the Presbyterian, and the Baptist. In numbers Mormons rank after the Episcopalians.

History. The territory from which Nevada was formed was acquired from Mexico by the Treaty of Guadalupe Hidalgo, Feb. 2, 1848, and later formed part of Utah Territory. The first European known certainly to have entered the

region was Francisco Garcés, a Franciscan friar, on his way to California from Sonora, in 1775. In 1825 Peter S. Ogden, in the employ of the Hudson's Bay Company, worked inland with a small party and came upon the Humboldt River, sometimes called the Ogden River after himself, or the Mary River after his Indian wife. Other trappers came within the next five years, though they suffered from the attacks of Indians. In 1826 Jedediah S. Smith crossed the entire breadth of the present State from west to east. In 1849 the Mormons founded a trading post in the valley of the Carson River, near the present town of Genoa, to supply gold seekers on their way to California. When Utah Territory was formed, Sept. 9, 1850, the western boundary was fixed as the summit of the Sierra Nevada Mountains and so included much of the present State, but the territorial organization did not extend at once to the extreme west, and the inhabitants organized a government of their own. In 1853, and again in 1856, the inhabitants of the Carson valley petitioned to be annexed to California, claiming that the government of Utah did not protect them and had even withdrawn the county government, so tardily given. In 1858 a provisional government was formed at Carson City with Isaac Roop as Governor. The Comstock Lode was discovered in June, 1859, and miners flocked thither from every direction. The new Territory was separated from Utah, March 2, 1861, being bounded on the east, however, by the 116th meridian. Another degree was cut from Utah, July 14, 1862, and on May 5, 1866, the eastern boundary was extended nearly to the 114th meridian and that part of the State below 37° was taken from Arizona. In September, 1863, an election was held for delegates to form a State constitution, but the instrument submitted was defeated in January, 1864. However, the political situation made two additional Republican votes in the United States Senate exceedingly desirable, and Congress, in March, 1864, again passed an enabling Act, in July the constitution was accepted, and the State was admitted on October 31. The State was Republican in national elections until 1892, when it was carried by the People's party. In the 1896, 1900, 1908, and 1912 presidential elections it voted for the Democratic candidates, but was carried by Roosevelt in 1904.

The State was so greatly disturbed in 1906-08 by strikes in the gold mines at Goldfield and other points that it was found necessary to send United States troops to preserve peace (See STRIKES). At the presidential election of November, 1908, Bryan received 11,212, Taft 10,777, and Debs 2203 votes. A Democratic Legislature was elected. The Legislature of 1909 passed several measures preventing Japanese from owning land in the State. In January of that year Francis G. Newlands was reelected to the United States Senate. In 1910 Tasker L. Oddie, Republican, was elected Governor. George D. Nixon, Republican, received the preferential vote for the United States Senate. Senator Nixon died in 1912, and the Governor appointed W. A. Massey, former Chief Justice of the Supreme Court, to fill out his term. In the presidential election of that year Wilson received 20,437, Taft 17,733, Roosevelt 8347, and Debs 2859 votes. A Democratic Legislature was elected. The Legislature of 1913 made more stringent the divorce law, which up to that time had been very lax. This law, becoming effective

on Jan. 1, 1914, was practically repealed the next year. In the State elections held in 1914 the Democrats elected E. D. Boyle Governor. Senator Newlands was reelected United States Senator. An amendment providing for woman suffrage was also adopted at this election.

The Governors of Nevada have been as follows:

TERRITORIAL		
James W. Nye		1861-64
STATE		
Henry G. Blasdel	Republican	1864-70
Louis R. Bradley	Democrat	1870-79
John H. Kinkade	Republican	1879-83
Jewett W. Adams	Democrat	1883-87
Christopher C. Stevenson	Republican	1887-90
Frank Bell	"	1890-91
Roswell K. Coleord	"	1891-95
John E. Jones	Silver	1895-96
Richard Sadler	"	1896-1903
John Sparks*	Silver-Democrat	1903-06
D. S. Dickerson	Democrat	1907-10
Tasker L. Oddie	Republican	1911-14
E. D. Boyle	Democrat	1915-
* Died in office		

Consult: Angel, *History of Nevada* (Oakland, 1881), Bancroft, *Nevada, Colorado, and Wyoming* (San Francisco, 1890); *Nevada and her Resources* (Carson City, 1894).

NEVADA. A city and the county seat of Story Co., Iowa, 35 miles north by east of Des Moines, on the Chicago, Rock Island, and Pacific and the Chicago and Northwestern railroads (Map: Iowa, D 2). It is the centre of a farming and cattle-raising district, and has a large cold-storage plant for butter and eggs, and some manufactures, the chief products being tile and brick, furnaces, cavers, automobile trucks, plows, candy, cement posts, auto tire gauges, and flour. The city maintains the Iowa Sanitarium, Oak Park Academy, and a public library, and it owns the water system. Pop., 1900, 2472, 1910, 2138, 1915 (State census), 2681.

NEVADA. A city and the county seat of Vernon Co., Mo., 103 miles by rail south of Kansas City, on the Missouri Pacific and the Missouri, Kansas, and Texas railroads (Map: Missouri, B 4). It has a Roman Catholic convent school, a State hospital for the insane, the Weltmer Institute of Suggestive Therapeutics, and Cottey College for Young Ladies (Methodist Episcopal, South), opened in 1884. A prominent feature of the city is Radio Springs Park, containing mineral springs which have medicinal properties. The Spring of Pawhuska is also of interest. Nevada controls considerable trade in the products of the agricultural and stock-raising district of which it is the centre, and has large zinc smelters, iron works, a foundry, and saw, planing, flour, and feed mills. Nevada was incorporated in 1870. It is governed by a mayor and a unicameral council. Pop., 1900, 7461; 1910, 7176.

NEVADA, EMMA (EMMA WIXOM) (1862-). An American dramatic soprano, born in Austin, Nev. She studied under Marchesi in Vienna and afterward in Italy. She first appeared in opera in London (1880) with Marie Van Zandt and subsequently sustained leading parts in Trieste, Pesth, Prague, Milan, Rome, Naples, and Paris, making her first professional tour of the United States in 1884-85. She had a wide repertoire, which included almost all the great coloratura parts and many parts demanding pathos.

NEVADA CITY. A city and the county seat of Nevada Co., Cal., 166 miles northeast

of San Francisco; the terminus of the Nevada County Narrow Gauge Railroad (Map: California, D 3). It is a popular health and summer resort, being esteemed for its equable climate and for its fine site, at an elevation of 2500 feet in a mountainous region. The city contains a Carnegie library, county courthouse, high school, and an Elks Home. Near by are valuable gold mines, Nevada County being the leading gold-mining county in California. The leading occupations are gold, quartz, and placer mining, horticulture, farming, truck gardening, and dairying. Under a charter of 1885 the government is vested in a president and board of trustees elected on a general ticket. The city owns and operates the water works. Nevada City was first settled in 1849, and in 1850-51 was the most important mining town in the State. It was incorporated in 1875. Disastrous fires occurred in 1851, 1856, 1858, and 1863. Pop., 1900, 3250; 1910, 2689.

NEVADA STATE UNIVERSITY. A State university for higher education founded at Elko in 1873. In 1875 it was removed to Reno, and was formally reopened in the following year. The university is the head of the educational system of the State and is the only institution of collegiate grade within its borders. It comprises the college of agriculture, including the school of home economics and the division of agricultural extension, the college of arts and sciences, the college of engineering, including the Mackay school of mines, school of mechanical and electrical engineering, the department of education of the summer season for teachers. Military instruction forms part of the curriculum, and a uniform is worn by students in military work. The degrees conferred by the university are A.B., S.B., A.M., S.M., and mining, mechanical, and civil engineer. The total enrollment in all departments in 1915 was 388, and the faculty numbered 56. The library contains about 30,000 volumes. The university covers 53 acres, and its property was valued in 1915 at \$523,268. The income from all sources in that year was about \$200,000. The president in 1915 was Archer W. Henry.

NEVADITE. See **RHYOLITE**.

NÈVE, nã'vã'. See **GLACIER**.

NEVERS, ne-vãr'. The capital of the Department of Nièvre, France, and formerly of the Province of Nivernais, situated on a hill in the midst of fertile plains at the confluence of the Loire and the Nièvre, 140 miles southeast of Paris (Map: France, N, J 6). The old portion of the town is ill built, with narrow, crooked streets, but the later portion is more modern and has a large park. A gateway, containing a Gallo-Roman museum, and two towers are preserved remains of the mediæval fortifications. The feudal ducal castle is utilized for the Palace of Justice and also contains a ceramic museum. The chief ecclesiastical buildings are the Romanesque eleventh-century church of St. Etienne and the restored cathedral of St. Cyr, built in the thirteenth century on the site of a prior church, the west portion of which is incorporated in the present building. The cathedral is noted for its double apse and fine sculptures and paintings. The town possesses a public library of 30,000 volumes, a teachers' training college, an ecclesiastical seminary, and an art school. It has manufactures of iron and copper ware, chemicals, porcelain, cloth, glue, shoes, fur garments,

dyes, rope, and agricultural implements, an engine-fittings factory, formerly a famous naval cannon foundry, and oil mills. Near by are found earths used in faience. Eight miles northwest is the watering place Pougues-les-Eaux. Nevers is the ancient Noviodunum, an important town of the Ædui. It has been an episcopal see since the sixth century, when it was called Nivernum. The town became the seat of the counts of Nevers in the tenth century and was created a dukedom by Francis I in 1538. The Dukedom of Nevers passed by marriage to a member of the family of Gonzaga, the ducal house of Mantua. On the extinction of the Gonzaga line in Mantua in 1627, Charles, Duke of Nevers, claimed the duchy. He was supported by France and opposed by Spain and Austria. The War of the Mantuan Succession which ensued ended in the recognition of the claim of Charles of Nevers in 1630. Pop., 1901, 27,673. 1911, 27,706.

NEVERSINK HIGHLANDS. A range of hills in New Jersey. See **NAVESINK HIGHLANDS**.

NEVIANSKY-ZAVOD, nêv-yân'ské-zã-vôt'. A mining settlement in the Government of Perm, Russia, situated on the Neiva, in the Ural Mountains, 62 miles north of Ekaterinburg. It is the centre of an important mining district and contains extensive ironworks, steel mills, and gold washeries. The settlement was founded in 1699. Pop., 1897, 16,066; 1910, 17,500.

NEVILLE, GEORGE (c.1432-76). An English divine. He was educated at Balliol College, Oxford. Through the influence of his father, the Earl of Salisbury, then Chancellor of England, and of his brother, the Earl of Warwick (q.v.), his preferment was rapid. From 1453 to 1457 he was Chancellor of Oxford University, he became Bishop of Exeter in 1458, and was appointed Archbishop of York in 1464. Participating in the stormy politics of the time, and one of the Yorkist peers who placed Edward IV on the throne, Neville was rewarded in 1460 with the chancellorship of England. He was deprived of his high office in 1467, and, when Warwick revolted against the King in 1469, the latter was a prisoner in Neville's hands for a short time, but was permitted to escape. During the short reign of Henry VI in 1470-71 he held the chancellorship, but surrendered himself and Henry to Edward after the latter had returned from Holland and defeated Neville's brother, Warwick, at Barnet. He was imprisoned in the Tower for a short time, was pardoned, but was again imprisoned in 1472-75 in France on a charge of treason.

NEVILLE, RICHARD, EARL OF WARWICK. An English political leader known as the King-maker. See **WARWICK, RICHARD NEVILLE, EARL OF**.

NEVILLE'S CROSS, BATTLE OF. A battle between the Scotch and the English, fought on Oct. 17, 1346. During the Hundred Years' War (q.v.) the Scotch were the firm allies of the French, and, when Edward III invaded France, King David II of Scotland prepared to harass England. He was met, however, at Neville's Cross, near Durham, by the English under Henry Percy and Ralph Neville. The English, owing to their archers, were completely victorious, and David himself was captured. See **BRUCE, DAVID**.

NEVIN, ARTHUR FINLEY (1871-). An American composer, brother of Ethelbert Nevin. He was born at Vineacre, Edgeworth, Pa., was educated at Sewickley (Pa.) Academy and at Park University (Allegheny, Pa.), and studied

at the New England Conservatory of Music in Boston in 1891-95 and then at Berlin under Klindworth and Boie. His compositions include: a book of four *May Sketches*; *Pierrot's Guitar*; and the songs *Were I a Tone, In Dreams*, and *Free as the Tossing Sea*. His North American Indian opera, *Poa*, was produced at the Royal Opera of Berlin in 1910.

NEVIN, ETHELBERT (1862-1901). An American composer, brother of A. F. Nevin. He was born at Edgeworth, Ia. After thorough preparation under local music teachers he went to Berlin (1884) and became a pupil of Von Bülow and Karl Klindworth, the former of whom particularly encouraged his natural gift for composition. He returned to Boston in 1887 and settled there, devoting himself largely to composition, but after 1893 he spent much of his time in Europe, mostly in Paris, the south of France, Italy, and Algiers. He returned to America in 1900 and became associated with H. N. Parker in the department of music at Yale University. He was the composer of many songs, instrumental pieces, and waltzes, almost all of which are marked by delicacy. He died at New Haven, Conn. Consult V. Thompson, *The Life of Ethelbert Nevin* (Boston, 1913).

NEVIN, JOHN WILLIAMSON (1803-86). An American clergyman. He was born in Franklin Co., Pa., graduated from Union College in 1821, studied theology at Princeton, and taught Hebrew there from 1826 to 1828. From 1820 to 1840 he was professor of Hebrew and biblical literature in the Western Theological Seminary at Allegheny, Pa. From here he went to the theological seminary of the Reformed (German) church at Mercersburg, where he taught theology until 1851. He was president of Marshall College, Mercersburg, from 1841 to 1853. After this institution had united with Franklin College at Lancaster under the name of Franklin and Marshall, he served as president from 1866 to 1876. He was one of the founders of the Mercersburg theology (q.v.). He was the editor of and principal contributor to the *Mercersburg Review* from 1849 to 1853. He published *Biblical Antiquities* (2 vols., 1828, rev. ed., 1849); *The Anxious Bench* (1842); *The Mystical Presence* (1846); *History and Genius of the Heidelberg Catechism* (1847); *Anti-Christ*; or, *the Spirit of Sect and Schism* (1848). Consult his biography by Appel (Philadelphia, 1889).

NEVIS, nē'vis. One of the Leeward Islands in the West Indies, belonging to Great Britain. It lies 2 miles southeast of St. Christopher, with which it is administratively connected (Map: West Indies, G 3). Area, 50 square miles. It consists largely of an extinct volcano, 3596 feet high and wooded at the summit. The lower slopes are fertile and well cultivated, producing sugar cane and some limes and oranges. Pop., 1901, 12,774; 1911, 12,945. The chief town is Charlestown (q.v.). The island was discovered by Columbus in 1498 and was colonized by the English in 1628. In 1899 it suffered from a disastrous hurricane. Nevis was the birthplace of Alexander Hamilton.

NEVIS, BEN See BEN NEVIS.

NEVSKI, ALEXANDER. See ALEXANDER NEVSKI.

NEVSKI (nyé'ské) **PROSPEKT**. The chief street of St. Petersburg, extending for about 3 miles in a straight line and faced by some of the finest shops and public buildings of the city.

NEW, JOHN CHALFANT (1831-1906). An American politician, born at Vernon, Ind. He graduated at Bethany College (West Virginia) in 1851 and settled in Indianapolis, where he was admitted to the bar in 1852. Throughout the Civil War he served as quartermaster-general of Indiana. In 1862 he was also a member of the Indiana State Senate. For some years after 1865 engaged in banking, in 1875 New was appointed Treasurer of the United States by President Grant, and in 1882 President Arthur appointed him Assistant Secretary of the Treasury. He was active in securing the nomination and election of Benjamin Harrison to the presidency in 1888 and the next year was appointed Consul General in London. This office he held until 1892. In later years he was proprietor of the Indianapolis *Journal*.

NEW ACADEMY. A school of Greek philosophers, the successors and expositors of Plato. The various schools classed under the name of the Academy are differently divided by modern historians. The third school, headed by Carneades (q.v.), is sometimes referred to as the New Academy, though it is perhaps more often classed, with the second, under the name of Middle, the New beginning a little later with Philo of Larissa, who founded the fourth school. See ACADEMY.

NEW ALBANY. A city and the county seat of Floyd Co., Ind., on the north bank of the Ohio River, 2 miles below the falls and opposite Louisville, Ky., with which it is connected by a very long steel railroad bridge, and on the Southern, the Chicago, Indianapolis, and Louisville, the Baltimore and Ohio Southwestern, and the Pittsburgh, Cincinnati, Chicago, and St. Louis railroads (Map Indiana, F 8). It has a fine courthouse, post office, and customhouse, Scribner's Park, St. Edward's Hospital, and a public library. In the suburbs there is a national cemetery which contains 2908 graves, 676 of unknown dead. The city controls large commercial interests and is an important manufacturing centre, having tanneries, automobile and furniture factories, engine and boiler works, rolling and planing mills, iron foundries, a rug factory, and pork-packing establishments. Clay is found in the vicinity. New Albany was laid out in 1813 and incorporated as a city in 1839, the charter of that year being still in operation and providing for a mayor, chosen every four years, and a unicameral council, which elects subordinate municipal officers. Pop., 1900, 20,628, 1910, 20,629.

NEW ALBION. See ALBION, NEW.

NEWALL, nū'āl, HUGH FRANK (1857-). An English astronomer, born at Gatehead-on-Tyne, where his father, Robert Stirling Newall, had a private observatory. The son was educated at Rugby and at Trinity College, Cambridge, from 1886 to 1890 was assistant in physics at Cambridge, and then became professor of astrophysics and director of the solar physics observatory, using the large equatorial telescope given the university by his father in 1891. Besides technical papers he wrote a popular manual, *The Spectroscope and its Work* (1910).

NEW ALMADEN, āl'mā-dēn'. A village in Santa Clara Co., Cal., 13 miles south of San José. The famous old Almaden mine, with the largest total production to date of all United States quicksilver producers, is located here. The value of its product since 1848 is estimated at \$60,000,000. Pop., 1915 (local est.), 140.

NEW AMSTERDAM. The name of New York City (q.v.) under the Dutch.

NEW ARAD. See ARAD.

NEW ARCHANGEL. The former name of Sitka (q.v.).

NEWARK, nū'erk, or **NEWARK-UPON-TRENT.** A municipal borough and market town of Nottinghamshire, England, on the Devon, a navigable branch of the Trent, 16 miles southwest of Lincoln (Map: England, F 3). Newark is one of the most important malting towns in England and has flour mills, breweries, manufacturing of iron, brass, plaster of Paris, agricultural implements and boilers, gypsum and limestone quarries, and a trade in corn, malt, and flour. The corn market is one of the largest in the Kingdom. The parish church of St. Mary, a large and elegant edifice, though often rebuilt, still shows traces of its original Norman character. The grammar and song school was founded in 1529. There are also the town hall, corn exchange, library, and mechanics' institute. Newark was incorporated in the reign of Edward VI and received further charters from Charles I and Charles II. The town owns the water works and markets and maintains public baths. It dates from the Roman occupation. The castle, now in ruins, was built early in the twelfth century. King John died in it in 1216. From its position and great strength it was called the Key of the North and during the Civil War sustained three sieges for Charles I, finally surrendering at his request to the Scots in 1646. Pop., 1901, 14,992; 1911, 16,408. Consult Cornelius Brown, *Annals of Newark-upon-Trent* (London, 1879).

NEWARK. A town in Newcastle Co., Del., 12 miles west by south of Wilmington, on the Baltimore and Ohio and the Philadelphia, Baltimore, and Washington railroads (Map: Delaware, H 1). It is the seat of Delaware (State) College (q.v.), Delaware Agricultural Experiment Station, the Women's College of Delaware, established in 1914, and State Board of Health Laboratories. There are paper manufactures, wall-paper mills, fibre works, machine shops, etc. The water works and electric-light plant are owned by the municipality. Pop., 1900, 1213; 1910, 1913.

NEWARK. The metropolis of New Jersey, county seat of Essex County, and a port of entry, extending from the Elizabeth city line north 3 miles along the west bank of Newark Bay to the mouth of the Passaic River and 7½ miles up the river to Belleville, located 8 miles west of the Hudson, on the Pennsylvania, Lehigh Valley, Central of New Jersey, Lackawanna, and Erie railroads, in lat. 40° 41' N. and long. 74° 10' W. (Map: New Jersey, D 2).

The city's area is 23.4 miles. It is fairly level for about a mile from the water front, when the ground rises in a series of plateaus. Beyond these, north, west, and southwest, are a cluster of smaller municipalities—Belleville, Bloomfield, Montclair, Glen Ridge, East Orange, Orange, West Orange, South Orange, and Irvington—and to the east are East Newark, Harrison, and Kearny, facing Newark from the east bank of the Passaic River. The latter group is strung together as one city and reached from Newark by several bridges, trolley and steam-railway lines. The suburban communities to the west and north surround Newark crescent-like, built so close to the big city as to give no sign where one ends or the other begins. All

these municipalities are included in a Greater Newark, the population of which was more than half a million in 1915.

Newark is distinctly a manufacturing centre, is often called the Birmingham of America, is financially one of the strongest municipalities of its size, is the third most important insurance-company home centre, and ranked fourteenth in population in 1910. The census total of Newark's inhabitants in 1910 was 347,469; in 1900, 246,070; in 1890, 181,830; in 1880, 136,508; in 1860, 71,941; in 1830, 10,953; in 1810, 8008. In 1798 the total was 2500 and, in 1713, 300. In 1915 the population, as taken by the State, was 366,744.

Among manufacturing centres Newark is eleventh in total annual value (nearly 300 varieties) of finished products, about \$202,000,000, which ranks it ahead of 30 States of the Union in this respect. Fifty of its industries turn out more than \$1,000,000 each in value yearly. Among some of the better known products are fine jewelry, cut glass, celluloid, shoes, patent leather, cutlery, chemicals, thread, electric machinery and appliances, hats, paints and varnish, malt liquors, and foundry products. Capital invested in manufacturing is about \$154,233,000, number of industrial operatives 60,000, total annual wages paid them \$45,000,000, and annual cost of raw material employed \$114,000,000. The annual total of freight received and shipped by rail is 5,316,000 tons and by water 3,125,000 tons.

Newark has nine national banks, one State bank, and 10 trust companies (Jan. 1, 1915), with total resources of \$127,560,568, capital \$11,000,000, surplus, etc., \$14,710,000, and deposits of \$84,856,000. There are also five savings banks with deposits of \$44,585,149. This financial machinery is emphasized by the city's being the home of two of the larger life-insurance and four well-known fire-insurance companies of the country. Newark's total of life-insurance-company assets is \$448,489,000 and fire-insurance-company assets \$20,519,000. Total resources of its building and loan associations amount to \$37,169,000.

The terraces back of the business part of the city form the residential section, supplemented by the closely adjoining municipalities named, all being interwoven by 28 electric trolley lines carrying over 450,000 passengers daily. To these must be added the high-speed electric line which connects Newark and New York via tubes under the Hudson, in addition to commutation and other accommodation by five trunk-line steam railroads. The area of the city's numerous small parks in all is greater per square mile of territory than that of any other city in the United States and is valued at \$10,000,000. It has a million-dollar free public library, two law libraries, and one historical society.

In cost and architectural impressiveness the home buildings of life and fire insurance companies, several of the banks, and the municipal and county buildings would distinguish any city. More than 66,000 pupils attend 68 public grammar and high schools, and 19,000 attend 35 or more parochial and private schools. There are 27 public-school playgrounds. Religious life is represented by 150 Protestant churches, 32 Roman Catholic, and 8 Jewish temples and synagogues. Among the first named are 33 Presbyterian churches, 26 Baptist, 22 Methodist, and 16 Episcopalian. Supplementing them all are

5 orphan asylums, 12 hospitals, and 50 charitable organizations. There are 4 dramatic, 3 vaudeville, and 59 moving-picture theatres, the last with a total seating capacity of 43,000.

The city government consists of a mayor, elected every two years, and a unicameral common council, one-half elected each year, which is the legislative branch. Administration of the municipality's affairs rests with boards and commissions. Beyond legislating as to ordinances the main function of the council is to provide funds for carrying on the city's business. The mayor alone names the tax commissioners, city counsel, excise and assessment commissioners, trustees of the public library and police justices, the board of estimate, the playground and shade-tree commissions, and the board of education.

The mayor, with the consent of the council, names the police, fire, and health commissioners and the city auditor; and the council elects the treasurer, tax receiver, city clerk, and comptroller. The board of street and water commissioners is elective. Wide interest has been shown in the question of substituting the modern form of commission government. There are more than 60,000 buildings in the city, and the total municipal revenue is in excess of \$12,050,000. The annual expenditure for public schools is about \$3,000,000, for fire department \$760,000, and for police \$1,030,000. The city water works, with 300 miles of mains, cost more than \$11,000,000 and have a capacity of 50,000,000 gallons daily, delivered by gravity. The daily consumption is about 41,000,000 gallons and the storage capacity nearly 10,000,000,000 gallons. The gas and electric power and light supply is second to that of no other city. There are 300 miles of sewers, costing \$6,000,000, and 240 miles of streets, of which 170 are excellently paved. The net bonded debt is \$30,010,000, and the tax rate in 1914 was 2.08 on ratables, totaling \$403,199,000.

The city has spent \$2,000,000 for highways through the meadows to upper Newark Bay and for docks, where warehouses and railway spurs are to connect with deep-sea shipping, and an industrial and export-import ocean-rail transfer centre is to be established reaching the 300-foot channel of a depth from 20 to 25 feet, according to the tide.

Newark was settled in 1666 by Congregationalists, members of 30 families, Puritans, from Milford, Branford, and Guilford, Conn. They had purchased the land, virtually equal to the present Essex County, from the Lords Proprietors, who held it under grant from Charles II, but, when they arrived by vessel, found the Indian owners objected, and bought their rights for \$750 worth of weapons, tools, clothing, lead, etc. The town was originally called Milford, but shortly after, in honor of the home of their first pastor, was renamed Newark (at first New Work), from Newark-upon-Trent. The original settlers planned a community only for those whose religious beliefs were their own, but these views did not long continue. Government of the early settlement and practically until 1836 was by town meetings. Most of the earlier settlers were well to do. The first shoe industry there was started in 1680. The first tanyard was established in 1698 and the first free school in 1792. In 1776 Washington and 3000 troops were quartered at Newark. From 1748 to 1756 the College of New Jersey (now Princeton University) was located at Newark, going

thence to Princeton. Jewelry has been manufactured there since 1801, and there Seth Boyden, in 1819, was the first to make patent leather in the United States, he who, in 1828, discovered the process for making malleable iron. The hatting industry, still a Newark feature, took its rise there in 1810. In 1836 Newark was chartered as a city. Plans for the city's celebration of its two hundred and fiftieth anniversary in 1916 were drawn on a scale to attract nation-wide interest.

NEWARK. A village in Wayne Co., N. Y., 30 miles east by south of Rochester, on the Barge Canal and on the New York Central, the West Shore, and the Pennsylvania railroads (Map: New York, C 4). It has a public library and is the seat of the State Custodial Asylum for Feeble-Minded Women. The home of the Fox sisters, in which modern spiritualism (q.v.) originated, is at Hydesville, near Newark. The surrounding country is a productive agricultural region, and the chief industries of the village include fruit preserving, the growing of roses and nursery stock, and the manufacture of paper boxes, tin and enamel wares, wagons, furniture, and automobile wheels. The water works and sewage plant are owned by the municipality. Pop., 1900, 4578; 1910, 6227.

NEWARK. A city and the county seat of Licking Co., Ohio, 33 miles east of the State capital, Columbus, at the junction of the forks of the Licking River, on the Ohio Canal and on the Pittsburgh, Cincinnati, Chicago, and St. Louis, the Ohio Electric, and the Baltimore and Ohio railroads (Map Ohio, F 5). It has also good interurban electric-railway service. Situated in a plain surrounded by hills, Newark is attractively laid out, 20 miles of its streets being paved with vitrified brick and asphalt. Noteworthy features are the Auditorium, a splendid memorial to the soldiers and sailors who died in the Civil War, the Children's Home, courthouse, Federal building, public library, hospital, and Moundbuilders Park, a summer resort. Two of the most extensive earthworks of the mound builders are here, comprising a circular embankment, one mile in circumference, and a larger series of fortifications, called the Octagon Fort. Tributary to the city are fertile agricultural districts and areas of natural gas, coal, and sandstone. The manufacturing interests are very important, the establishments including electric-car works, table glassware and bottle works, locomotive shops of the Baltimore and Ohio, a large stove foundry, golf-stick works, a rope-halter factory, a hardwood saw mill, cigar, shoe, brick, and motor-truck factories, engine and machine works, an iron foundry, agricultural-implement works, flouring mills, a carriage factory, a chemical laboratory, etc. Newark was settled in 1801 and was laid out as a town in the following year. The water works, costing \$800,000, and the electric-light plant are owned by the municipality. Pop., 1890, 14,270; 1900, 18,157; 1910, 25,404; 1914 (U. S. est.), 28,271.

NEWARK, DAVID LESLIE, first LORD (1601-82). A Scottish soldier. He rose to the rank of colonel of horse in the service of Gustavus Adolphus. In 1640 he returned to Scotland to aid the Covenanters, became major general in 1643 under Alexander Leslie, Earl of Leven, and gave important aid to Cromwell in the battle of Marston Moor. After his capture of Carlisle in 1645 he was recalled to Scotland and made lieu-

tenant general of horse, and in September he practically annihilated the forces of Montrose in the south of Scotland. In 1650, when all parties in Scotland combined to support Charles II, Leslie was placed in chief command of the army, which was defeated by Cromwell at Dunbar. In 1651 Leslie was captured by the Cromwellian forces and imprisoned in the Tower. On the Restoration in 1661 he was created first Lord Newark.

NEWARK SERIES. The name given to the Triassic system in the eastern part of North America. Along the Atlantic coast from Nova Scotia to South Carolina there are many isolated areas of thick bedded red sandstones, conglomerates, and breccias, which throughout their extent exhibit marked uniformity of characteristics. The sedimentary rocks are accompanied by dikes and sheets of basalt indicating intense volcanic activity at the time of their formation. Fossils are rare and mostly of fresh-water or land types, the commonest being land plants and footprints of animals. The micaceous and feldspathic nature of the sandstone shows that it was derived from the waste of crystalline rocks. In North Carolina and Virginia the series contains workable coal seams, it also yields a good quality of building stone—the brown sandstone of Connecticut and New Jersey—and large quantities of trap for road building and engineering work. See TRIASSIC SYSTEM

NEW ART. The English equivalent of the French *art nouveau* and the German *moderne Kunst*, designating a movement in the arts of design which marked the close of the nineteenth and beginning of the twentieth century, the counterpart in architecture and decoration of the various secession movements in painting and sculpture. Beginning in sporadic individual efforts in Europe to break away from traditional formule, especially in the minor arts, it began to take on the character of a movement by 1893. The posters and *orfèvrerie* of Grasset and Chéret, the pottery, metal work, and jewelry of Delaherche, Gallé, and Chaplet, all in France, the vases and minor sculpture of Wolfers in Belgium, and the highly original if somewhat eccentric houses and furniture of a Darmstadt art colony led by Olbrich and Behrens, produced between 1893 and 1903, made a profound impression in Europe, especially in Belgium, Germany, and Austria. The underlying principle of the movement, baptized with the name of art nouveau in 1893 by Bing, the French art dealer and collector, is that of protest against tradition and formulated style, the assertion of the individual taste and imagination unhampered by rules or fashions. It is thus chiefly a negative movement, with no positive unifying element, and has not resulted in creating a definite style, though it has given rise to many striking and beautiful works, especially in the industrial and decorative arts. It has profoundly modified the style of so great a master of architectural design as Wagner of Vienna, though he was trained in the school of the academic styles. But it has also given birth to many architectural works of so eccentric and extravagant a character as to offend good taste by violating the fundamental principles of structural design, especially in Germany and Austria. Architecture is an art of construction, demanding subservience to basic laws of structural expression. In furniture these laws are less important, and in jewelry

and the minor arts the individual fancy may express itself with almost perfect freedom. In these arts, besides the artists already mentioned, the names of Charpentier, Guimard, Genuys, Gaillard, and Moreau-Vautier in France, of Jean Dampf and Hoentschel in France and Belgium, Brangwyn in England, and many others stand conspicuous for excellent work. Rodin (q.v.) has powerfully influenced sculpture, and Meunier, with his powerful, half-tragic naturalism, in Belgium, and Bitter in some recent works in this country, have shown that sculpture can display strong individualism in a new spirit without forsaking fundamental principles of design. In America tradition has been less dominant than in Europe, and, with less occasion for the spirit of protest, many artists have produced highly original designs without having to organize a movement under the label of new art.

NEW ATLANTIS. THE The name given by Lord Bacon, in his allegory bearing the same title, to an island supposed to lie in the southern Atlantic. See ATLANTIS

NEW BEDFORD. A port of entry and one of the county seats of Bristol Co., Mass., situated near the mouth of the Acushnet River, which expands into a fine spacious harbor that leads into Buzzards Bay (Map: Massachusetts, F 6). Fort Rodman, on Clark's Point, with a garrison of 125 men, defends the harbor entrance. On the opposite side of the harbor is situated the town of Fairhaven, with which New Bedford is connected by three bridges, one of which cost \$1,500,000 and is one of the features of the city. The city is 56 miles south of Boston and is the terminus of a division of the New York, New Haven, and Hartford Railroad. New Bedford is connected with Fall River, Taunton, and towns on Cape Cod by both steam railroads and trolley lines, and by passenger steamboat lines with Woods Hole, Marthas Vineyard, and Nantucket. The New England Navigation Company maintains excellent passenger service to New York during the summer months and freight service all the year. The harbor has been much improved by the national government, and the State Legislature of 1914 made an appropriation of \$350,000 for the erection of a shipping pier upon the harbor front. The area of the city is 19.39 square miles. It is regularly laid out, with 184 miles of paved or macadamized streets. Among the prominent buildings are the municipal building, the post office, the registry of deeds, the county courthouse, the third district courthouse of Bristol, the high school, the textile school, St Luke's Hospital, the Masonic building, the Institution for Savings, the Five Cents Savings Bank, the Merchants Bank, the Mechanics Bank, and the State Armory. The public library, completed in 1910, is one of the finest library buildings in New England, contains 150,000 volumes, and had a circulation in 1914 of 400,000. It is rich in genealogical material and has the largest collection of books on the subject of whaling in the country. It has an endowment fund of \$314,000 and receives annually from the city \$25,000 to \$30,000. The Old Dartmouth Historical Society, an institution of the city, also contains much material of interest, especially pertaining to the whaling industry. Public parks, aggregating 219 acres, are the Common, Brooklawn, Buttonwood, Hazelwood, Grove, and Ashley.

New Bedford was for many years the principal whaling port of the world, 59 whaling vessels being registered there in 1804. Arctic whaling, begun in 1848, marked a new era, and in 1857 New Bedford had 329 registered whaling ships. The Civil War, during which many vessels were either destroyed or purchased by the government, and especially the discovery of oil fields in Pennsylvania, caused a decline, and New Bedford is now distinctively a manufacturing city, the largest producer of high-grade cotton yarns and fancy woven fabrics of cotton and silk in the United States. In 1914 capital to the amount of \$47,820,575 was invested in the leading industries. The cotton mills in 1914 contained 3,010,195 spindles and 53,699 looms, and the employees numbered 31,820. There are also manufactories of silverware, cut glass, and specialties for textile lines, machine shops, foundries, oil manufactories, cordage works, paint works, lumber mills, etc. The trade of the city is considerable, the leading commodities being coal, cotton, lumber, oil, fish, and general merchandise.

Under the revised charter of 1896 the government is vested in a mayor, chosen annually, a bicameral council, the aldermen being nominated by wards, but elected on a general ticket, and administrative officers as follows: licensing board, city solicitor, chief of police, appointed by the mayor, health board, appointed by the mayor, confirmed by the aldermen, poor board, appointed by the mayor, confirmed by the council in convention, cemetery board, park board, trustees for public library, elected by the city council; school committee, consisting of the mayor ex officio and six members elected by popular vote. Most of the other city officers, as the city clerk, the city treasurer, the city auditor, etc., are elected by the city council in convention. The water works are owned and operated by the municipality. New Bedford spent in 1914, for maintenance and operation, \$2,225,831.50, the principal expenditures being, for schools, \$520,063.51; interest on debt, \$370,059.12; police, \$198,234.16; fire department, \$158,860.11; highways, \$289,909.43; charities and corrections, \$132,477.76; health, \$193,316.59; street lighting, \$105,359.39. The assessed valuation in 1914 was \$108,032,232.79, the bonded debt, \$9,951,989.05; sinking funds, \$1,777,453.51. Pop, 1790, 3313; 1880, 26,845; 1890, 40,733; 1900, 62,442; 1910, 96,652; 1915 (est.), 110,000.

New Bedford originally formed a part of the town of Dartmouth and was set off from it in 1787. In 1812 it was incorporated as a separate township and in 1847 as a city. The town was called Bedford for Joseph Russell, one of the founders, whose family name was the same as the Duke of Bedford, it was later called New Bedford to distinguish it from Bedford in Middlesex County. The site was visited by the English navigator Bartholomew Gosnold in 1652. It was settled in 1652 by John Cook and others from Plymouth, who purchased the land from Massasoit, sachem of the Narragansets, and his son Wamsutta. The famous Wamsutta Mills, the first cotton mills built in the city, and the Wamsutta Club, the leading social club in the city, perpetuate the name of the latter chief. During the Revolution New Bedford sent out many privateers and, from its convenient location, became the storehouse of captured prizes. On Sept. 5, 1778, an English fleet

of 32 vessels and an army under General Gray attacked the town, captured it, and reduced the greater part of it to ashes. Consult: Daniel Ricketson, *History of New Bedford* (New Bedford, 1858); L. B. Ellis, *History of New Bedford and its Vicinity, 1602-1892*; Z. W. Pease and G. W. Hough, *History of New Bedford: Industries, Institutions, and Attractions* (1889); *The Old Dartmouth Historical Sketches* (1903 et seq.), published by Old Dartmouth Historical Society.

NEWBERN, nū'bĕrn. A city, port of entry of the Pamlico district, and the county seat of Craven Co., N. C., 87 miles northeast of Wilmington, on the Neuse River at its confluence with the Trent and on the Atlantic Coast Line and the Norfolk Southern railroads (Map: North Carolina, E 2). It exports fish, cotton, lumber, and vegetables. It has ironworks, cottonseed-oil and lumber mills, foundries and machine shops, carriage and fertilizer factories, bottling and lime works, and extensive fish, oyster, lumbering, and truck-gardening interests. The most prominent architectural features of the city are the government building, the county courthouse, and two bridges over the Neuse and Trent rivers, both affording fine views of river scenery. The government, under a charter of 1899, is administered by a mayor, elected every two years, and a board of aldermen. The water works and electric-light plant are owned and operated by the municipality. Newbern was settled by Swiss in 1710, was for a time the capital of the Province of North Carolina, and for many years was its most important seaport. It was strongly fortified during the Civil War, but was captured by General Burnside, March 14, 1862, after a severe engagement 3 miles from the city, the Union loss being about 100 killed and 500 wounded. Pop, 1900, 9090; 1910, 9961, 1914 (U. S. est.), 10,281.

NEWBERRY. A city and the county seat of Newberry Co., S. C., 43 miles by rail west-northwest of Columbia, on the Columbia, Newberry, and Laurens and the Southern railroads (Map: South Carolina, C 2). It has a fine city hall and courthouse and Newberry College (Lutheran), which was opened in 1858. The centre of a productive cotton-growing region, Newberry carries on a considerable trade and manufactures cotton goods, cottonseed oil, fertilizers, coffins, etc. The government is administered, under a charter of 1894, by a biennially elected mayor and a unicameral council. The water works and electric-light plant are owned by the city. Pop., 1890, 3020; 1900, 4607; 1910, 5028.

NEWBERRY, JOHN STRONG (1822-92). An American geologist. He was born at Windsor, Conn., Dec. 22, 1822, and died at New Haven, Dec. 7, 1892. Most of his early life was spent in the Western Reserve of Ohio. He graduated from Western Reserve University at Hudson in 1846 and from the Cleveland Medical School in 1848. After two years at Paris, spent in post-graduate work in medicine and paleontology, he established himself as a physician in Cleveland (1851). In 1855 he joined an exploring expedition under Lieutenant Williamson, sent out by the War Department to examine the country between San Francisco and the Columbia River. His geological investigations were published as a separate volume of the *Reports of Explorations and Surveys to Ascertain the Most Prac-*

tical and Economic Route for a Railroad from the Mississippi River to the Pacific Coast, Made in 1855-56 (Washington, 1857). In 1857-58 he acted as geologist to an expedition headed by Lieutenant Ives, sent out to explore the Colorado River. Newberry's paper relating to the geology, physiography, and Indian tribes undoubtedly forms the most valuable and interesting part of the *Report on the Colorado River of the West, Explored in 1857-58* (Washington, 1861). The next year Newberry again went into the field, this time as naturalist of an expedition under Captain Macombe, which explored southwestern Colorado and adjacent parts of Utah, Arizona, and New Mexico. The results appeared in 1876 as *Reports of the Exploring Expedition from Santa Fé to the Junction of the Grande and Green Rivers* (Washington, 1876). During the Civil War Newberry served as secretary to the Sanitary Commission for the Mississippi valley. Afterward he became attached to the Smithsonian Institution, at the same time holding a professorship in Columbian (now George Washington) University at Washington, to which he had been called in 1857. In 1866 he was offered the chair of geology and paleontology in the School of Mines, Columbia College, which he accepted and held for 24 years. In 1869, when the Ohio Geological Survey was established, he was made director and personally did much of the work described in several of the reports. In addition he was a member of the Illinois Geological Survey and described the extensive collections of fossil plants gathered by Hayden's survey of the West. In 1867 he was elected president of the American Association for the Advancement of Science and in the same year was chosen president of the New York Academy of Sciences, a position which he held for 24 years. He was also president of the Torrey Botanical Club from 1880 to 1890, assisted in the organization of the Geological Society of America at Cleveland in 1888, and served as a member of the commission to organize an international geological congress, of which he was president in 1891. The Murchison medal of the Geological Society of London was awarded to him in 1888. In addition to the works above mentioned Newberry also wrote: *The Rock Oils of Ohio* (1859); *Iron Resources of the United States* (1874); *The Structure and Relations of Dinichthys* (1875); *Report on the Fossil Fishes Collected on the Illinois Geological Survey* (1886); *Fossil Fishes and Fossil Plants of the Triassic Rocks of New Jersey and the Connecticut Valley* (1888); *Paleozoic Fishes of North America* (1889); *Later Extinct Floras* (1898). Consult J. J. Stevenson, "Memoir," in the *American Geologist* (Minneapolis, July, 1893), and C. A. White, *Biographical Memoir of John Strong Newberry* (Washington, 1908).

NEWBERRY, PERCY EDWARD (1869-). An English Egyptologist, born at Ealing and educated at King's College, London. He first prepared himself to be a botanist and in this field wrote between 1888 and 1890 a *History of English Gardening*. But as early as 1884 he had become interested in Egyptology, and in 1890 he was appointed the officer in charge of the archaeological survey of Egypt for the Egypt Exploration Fund. Five years later he began a survey of the necropolis at Thebes which occupied him until 1901. Newberry served on the staff of the *Catalogue Général* of the museum at Cairo in 1902-03 and in 1907 was appointed

Brunner professor of Egyptology at the University of Liverpool. Among his numerous writings on the subject of his researches are: *Beni Hasan* (1891-93), *El Bersheh* (1893-94); *The Amherst Papyri* (1900); *The Life of Rekhmara* (1900), *The Tomb of Thouthmoss IV* (1904); *Scarabs* (1905); *Five Years Explorations at Thebes* (1912).

NEWBURY, JOHN (1713-67). A famous English bookseller and publisher, the son of a poor farmer of Waltham St. Lawrence in Berkshire. He attended the village school, but he educated himself mainly by reading. In 1730 he went to Reading, where he entered the service of William Carnan, editor of the *Mercury*. After the death of his employer, in 1737, he married his widow. Somewhat later he opened in London a bookshop and publishing house in St. Paul's Churchyard (1745). He started several newspapers, and among their contributors were Goldsmith and Dr. Johnson. To Newbury's *The Public Ledger* (founded 1760) the former contributed his *Criticism of the World*. Newbury was the first publisher to issue books especially for the young. His *Juvenile Library* was made up of dainty volumes bound in flowered and gilt Dutch paper. Among them were *Goody Two Shoes* (reprinted with introduction by C. Welsh, London, 1881) and *Tommy Trip*.

NEW BOGOSLOV. See GREWINGK ISLAND.

NEWBOLD, nū'bôld, (WILLIAM) ROMAINE (1865-). An American professor of philosophy. He was born at Wilmington, Del., and was educated at the University of Pennsylvania (A B, 1887; Ph D, 1891), where, after teaching Latin at the Cheltenham Military Academy in 1887-89, he was instructor in Latin, lecturer in philosophy, assistant professor of philosophy, professor in 1903-07, and Adam Seybert professor after 1907. He was also dean of the graduate school of the university from 1896 to 1904. In 1895-96 he was coeditor of the psychological department of the *American Naturalist*.

NEWBOLT, HENRY JOHN (1862-). An English writer, born at Bilston, Staffordshire, where his father was vicar. He was educated at Clifton College, Bristol, and at Corpus Christi, Oxford. Called to the bar at Lincoln's Inn (1887), he practiced law till 1899. In 1900-04 he edited the London *Monthly Review*. He is best known for his martial poems in *Admirals All* (1897) and *The Island Race* (1898, largely a reprint). Among his other publications are a novel entitled *Taken from the Enemy* (1892); *Mordred*, a tragedy; *Stories from Froissart* (1899), *Froissart in Britain*, with illustrations taken from originals in the British Museum (1900); *The Old Country*, a romance (1906); *The New June* (1909), *The Twymans* (1911); *Poems Old and New* (1912); *The Book of the Blue Sea* (1914), *Drake's Drum and Other Poems of the Sea* (1915). Consult William Archer, *Poets of the Younger Generation* (New York, 1902).

NEW BRAUNFELS, broun'fêlz. A city and the county seat of Comal Co., Tex., 31 miles northeast of San Antonio, at the confluence of the Guadalupe and Comal rivers, and on the Missouri, Kansas, and Texas and the International and Great Northern railroads (Map: Texas, C 5). Noteworthy features include Landa's Park and fine Federal and courthouse buildings. The Comal River, though short, is of considerable volume. The city is the dis-

tributing point for an extensive farming and cattle-raising district, and is industrially important because of its good water power, some of the largest flour mills in the State being situated here. The principal manufactured products include flour, cottonseed oil, leather, lime, and bricks. The water works and electric-light plant are owned by the city. Pop., 1900, 2097; 1910, 3165.

NEWBRIDGE. See PONTYPRIDD.

NEW BRIGHTON, brī'ton A borough in Beaver Co., Pa., 28 miles northwest of Pittsburgh, on the Beaver River and on the Pittsburgh and Lake Erie and the Pennsylvania Company railroads (Map: Pennsylvania, A 5). It has the Merriek Art Gallery, a home for the aged, a children's home, a fine Federal building, Beaver Valley General Hospital, Y. M. C. A. and public high-school libraries, and a public park. The river furnishes adequate water power, and there are deposits of coal and clay in the vicinity. New Brighton is an important industrial centre, its manufactures including pottery, bricks, sewer pipe, glass, flour, twine, lead kegs, refrigerators, bath tubs, wall paper, steel castings, nails, rivets, wire, etc. Pop., 1900, 6820; 1910, 8329, 1914 (U. S. est.), 8971.

NEW BRITAIN. The former name of the Bismarck Archipelago (q.v.); also applied to the largest island of the archipelago, now called New Pomerania (q.v.).

NEW BRITAIN. A city and town (co-extensive) in Hartford Co., Conn., 9 miles southwest of Hartford, on the New York, New Haven, and Hartford Railroad (Map: Connecticut, D 3). It has a State normal school and New Britain Institute, and two fine public parks, one of 90 acres developed and one of 138 acres undeveloped. New Britain is noted for its extensive manufactures, which, in 1909, represented an invested capital of \$32,000,000 and had a production valued at \$22,000,000. The manufacture of builders' hardware and cutlery is particularly noteworthy. Other important manufactures are hardware, foundry and machine-shop products, cutlery and edge tools, hosiery and knit goods, stamped ware, saddlery, buckles, etc. Situated in a fertile agricultural district, New Britain also has some farming and peach-growing interests. The government is administered, under a consolidation charter of 1905, by a mayor, chosen every two years, a unicameral council which controls elections of the majority of subordinate municipal officers, and commissions appointed by the mayor. The city clerk and treasurer, collector, auditor, and school board are, however, chosen by popular vote. There are municipal water works and municipally owned underground ducts. The city's income in 1914-15 was \$1,332,211, while its payments amounted to \$1,189,014, the chief items of expenditure being \$55,394 for police department, \$47,372 for fire department, and \$208,172 for education. Pop., 1900, 25,998; 1910, 43,916, 1915 (U. S. est.), 52,203. New Britain was settled in 1687 and was incorporated as a parish under the name New Britain Society in 1754. It was separated from Berlin and incorporated as a township in 1850, and in 1871 was chartered as a city. This was the birthplace and home of Elihu Burritt (q.v.). Consult Camp, *History of New Britain* (New Britain, 1889).

NEW BRUNSWICK, brūnz'wīk. A province of the Dominion of Canada. It lies between

lat 44° 30' and 48° 6' N. and long. 63° 47' and 69° 5' W., and is bounded on the north by Quebec and the Bay of Chaleur, on the east by the Gulf of St. Lawrence and Northumberland Strait, on the south by Nova Scotia and the Bay of Fundy, and on the west by the State of Maine and Quebec (Map: Canada, R 7). It has an area of 27,985 square miles, including 74 square miles of water area.

Topography. The coast on the Gulf of St. Lawrence is low and sandy, with numerous spits and lagoons; that on the Bay of Fundy is bold and rocky. The latter is protected from the scouring action of the extraordinarily high tides by a ridge of hard Cambrian rock, with small areas of Silurian and Devonian as well as of the older Huronian and Laurentian systems. Another ridge, composed of granite, traverses the province from the southwest to the northeast corner. It forms the main divide between the eastern and western rivers, and has an average height of 1000 to 1500 feet, with a number of detached monadnocks from 2000 to 2500 feet high. These ridges are regarded as outlying branches of the Appalachian system. They inclose between them a large, triangular tract of low, undulating plain, occupying the eastern half of the province, and underlain by the Carboniferous system. West of the dividing range is a Silurian plateau much eroded and trenched by the valley of the St. John River. The geology of the province is somewhat confused and not yet definitely understood; but it is probably in many respects similar to that of Nova Scotia (q.v.).

Nearly all the western half of New Brunswick is drained by the river St. John, which, after forming for a long distance the boundary between the Province of New Brunswick and the State of Maine, flows through the province in a southerly direction as far as the forty-sixth parallel, then turns to the east and discharges into the Bay of Fundy through an estuary extending north and south for about 50 miles. The northeastern part of the province is drained into the Gulf of St. Lawrence through a large number of small streams. There are numerous lakes. Grand Lake, in the south-central portion, is the only one of considerable size. The coast line is 500 miles in extent, and is indented by spacious bays, inlets, and harbors. The tides, which have a great range in height, the spring tides at the head of the Bay of Fundy rising 50 feet, determine in many instances the hours of movements of vessels. The chief bays are: Fundy, Chignecto, and Cumberland, the last two being merely extensions of the first, Passamaquoddy Bay in the south; Verte, Shediac, Cocagne, Richibucto, and Miramichi bays on the east; and the Bay of Chaleur, 90 miles long by 12 to 25 broad, in the northeast.

Climate. New Brunswick is subject to extremes of heat and cold. At inland points the extremes are greatest, the temperature sometimes falling to 30° below zero F. in the winter and rising to 95° F. in the summer. The atmosphere, however, is drier than on the coast, and the extremes do not occasion great discomfort. Spring opens later and summer lingers longer than in the provinces farther west. The rainfall for the province averages above 40 inches.

Mining. Although a large part of the province is occupied by Carboniferous strata, the mineral coal is for the most part impure or in

thin seams, and is but little worked. The coal-like mineral albertite, formerly mined with great profit in Albert County, has long since been exhausted. Salt springs are numerous. Nickel and iron ore are found, as are also antimony and manganese. Valuable copper deposits were reported to be discovered in 1913 at Black River, near St. John. Gypsum, plumbago, grindstone, and limestone are very abundant, and the freestone of the province, unsurpassed for beauty and durability, commands a high price in the United States. The value of the mineral production in 1913 was \$1,049,320.

Fisheries. From an early period fishing has been one of the leading industries. The waters on both coasts rank among the best fishing grounds of the world. Fish breeding is assisted by the Dominion government. New Brunswick has 7 of the 51 fish hatcheries in Canada. For a decade and a half the annual earnings from fisheries have been about \$4,000,000, Nova Scotia alone, among the Maritime Provinces, exceeding that amount. New Brunswick thus nearly ranks with Massachusetts, which is the leading sea-fishing State of the United States. The herring, smelt, sardine, and lobster fisheries are of greatest importance, and in the first three New Brunswick leads all the other provinces. For the fiscal year 1913 the value of the catch was \$4,264,054. There were 21,675 men engaged in the industry.

Agriculture. The kind and quality of soil vary greatly with the underlying geological formation, but it is generally fertile, though much of the surface is too hilly to admit of profitable cultivation. In most of the valleys, and in the diked districts, e.g., at the head of the Bay of Fundy, the fertility is of a high grade. Originally the whole area was covered with forests, of which about one-half has been removed. The nature of the forests is not uniform, but they usually consist of both hard and soft woods. On the Bay of Fundy the species are largely confined to spruces and firs, as a consequence of the cold winds of that region. Spruce, fir, and tamarack also prevail in the western part of the province. But farther eastward the hardwood varieties, such as maple, beech, ash, and birch, prevail, interspersed with spruce and pine. The elm abounds in the river valleys, and with it are found the birch and red maple. According to the forestry branch of the Department of the Interior at Ottawa, the estimated acreage of commercial timber in 1914 was 9,000,000. In 1902 a law was passed for the establishment of a large national park and game preserve at the sources of the Tobique, Nipisiguit, and Miramichi rivers. Excellent laws protect fish and game (See GAME LAWS). The destruction of the forests in New Brunswick, as in the other Maritime Provinces, seems to have had a climatic effect quite different from that which usually follows, viz., the rainfall increases, resulting in the growth of the soft woods—balsam, spruce, and tamarack—in the region where the hard woods were removed.

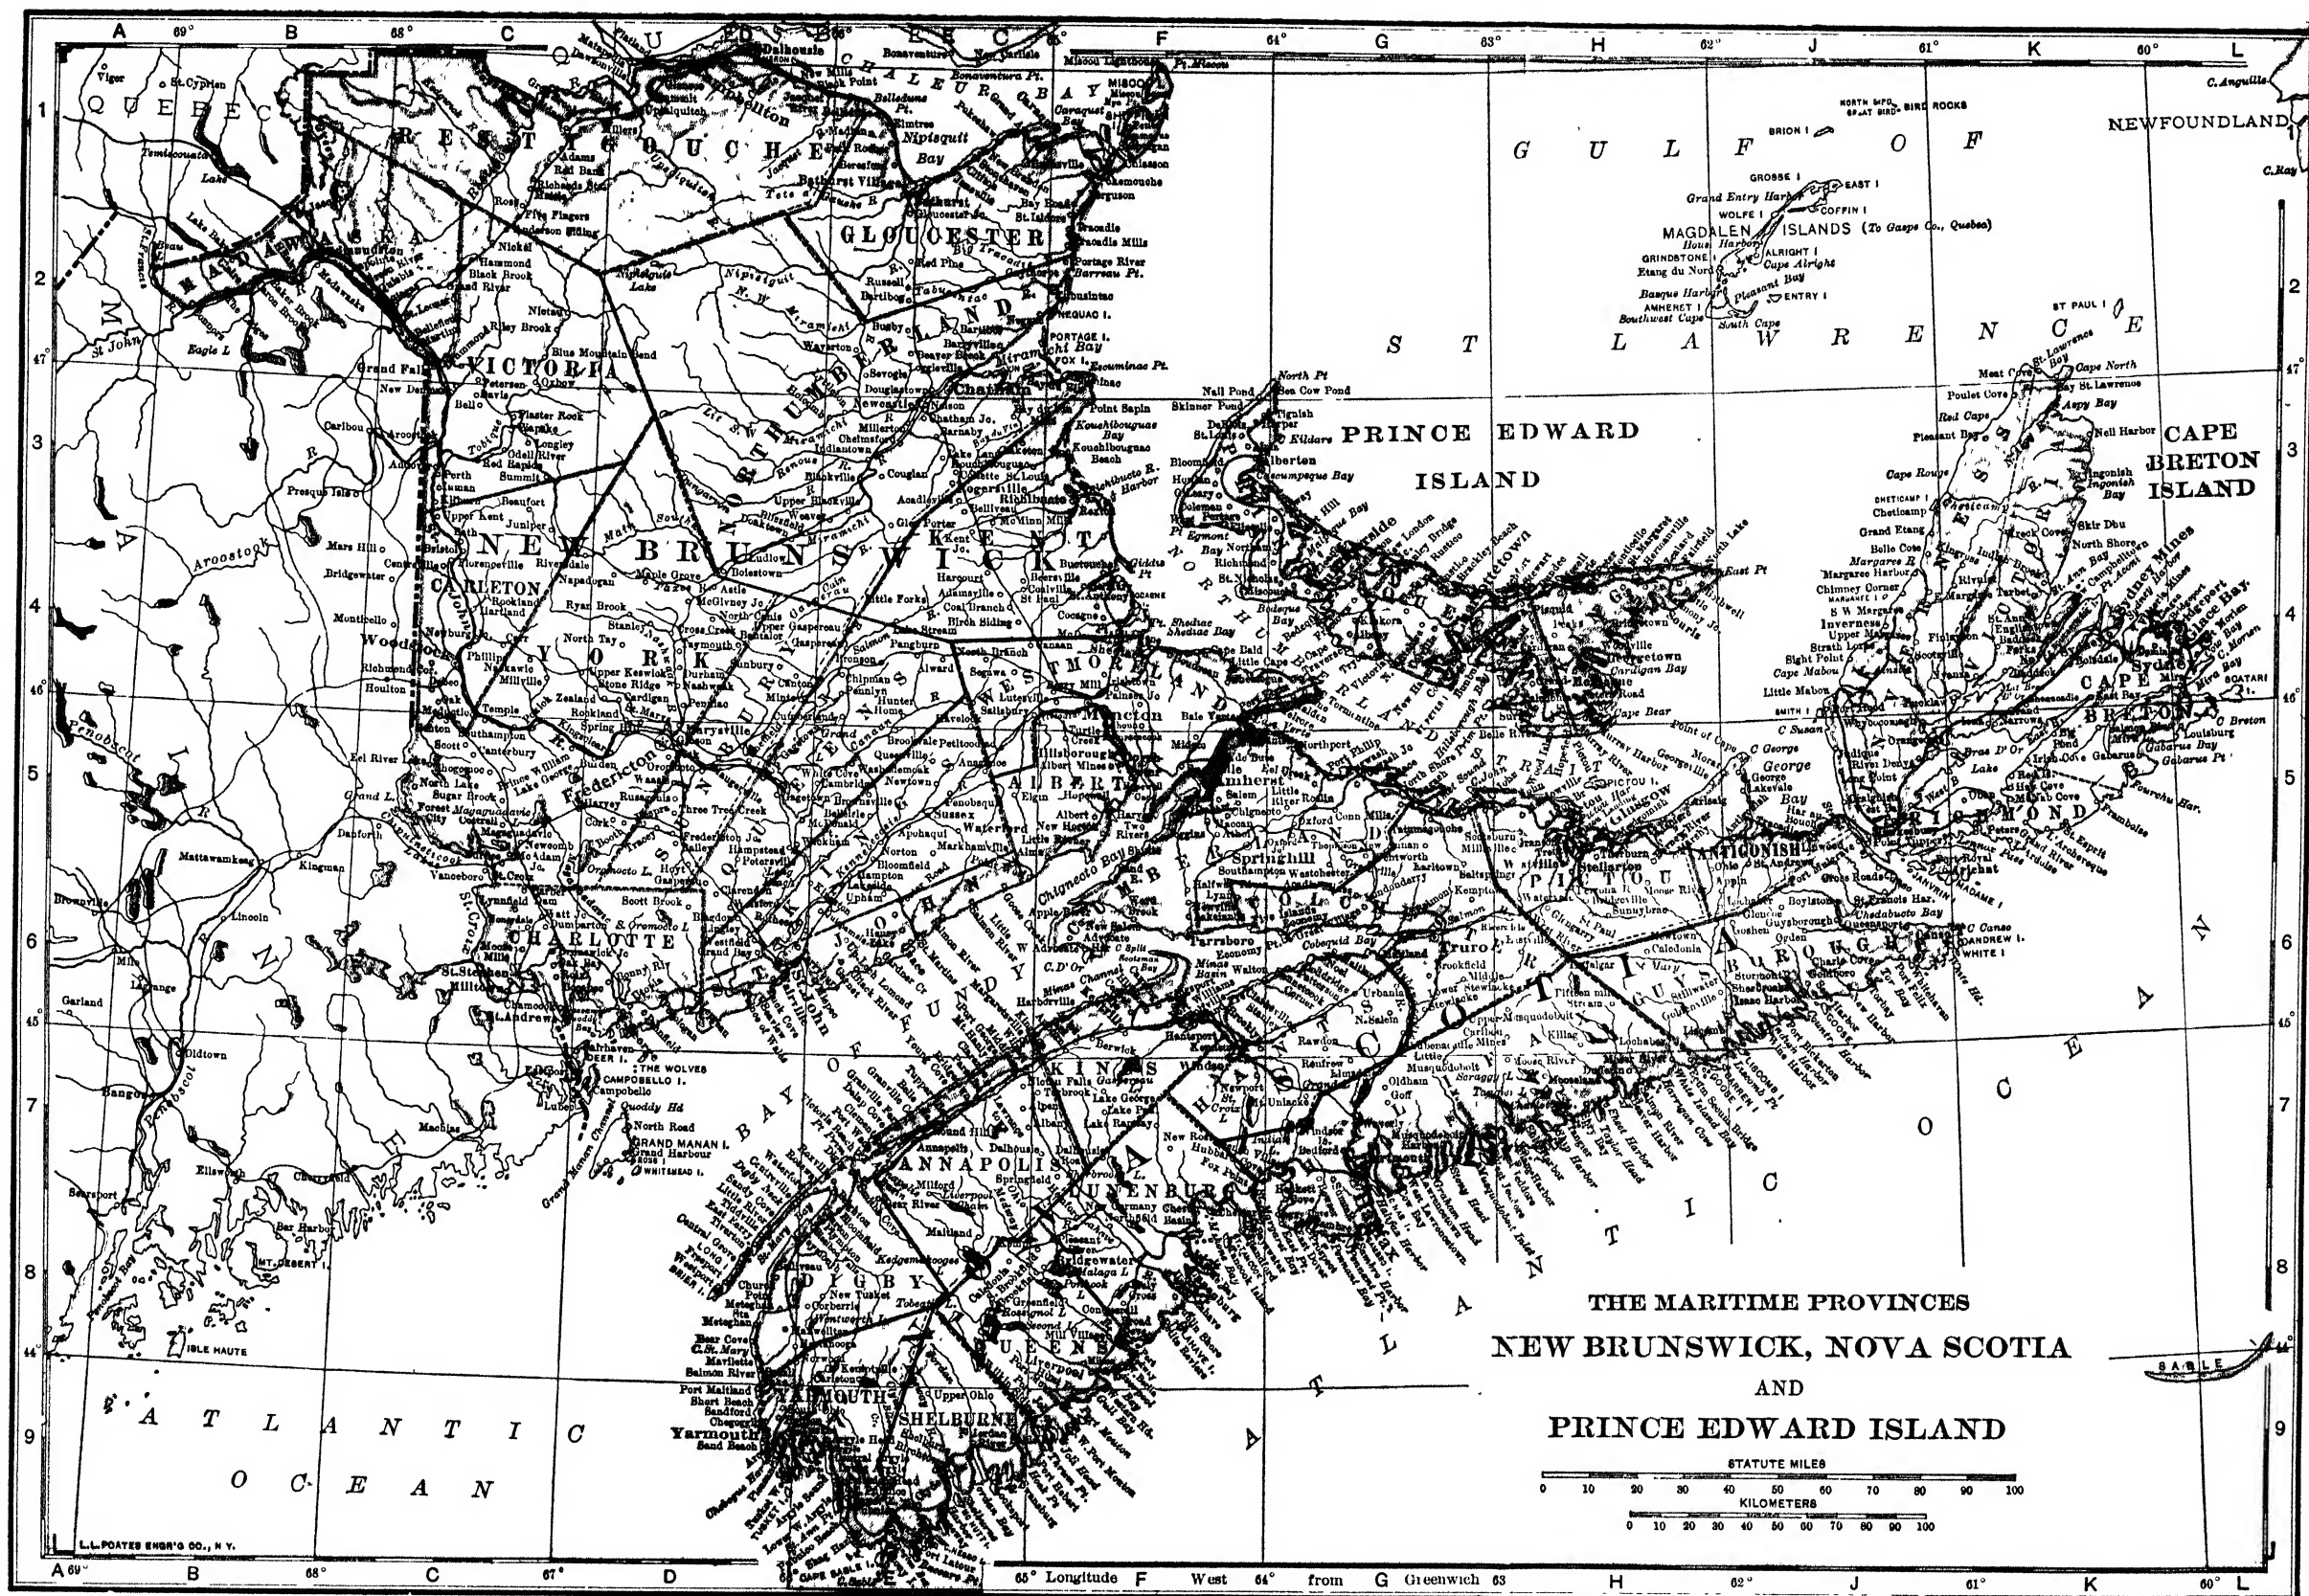

Agriculture is the leading occupation, but it has not reached extensive proportions. The natural growth of marsh hay in the valleys supplies an abundant and valuable hay product. Hay, potatoes, oats, turnips, and buckwheat are the most valuable field crops. In 1913, 577,000 acres of hay and clover yielded 698,000 tons, valued at \$7,615,000; 43,500 acres of potatoes yielded 10,629,000 bushels, valued at \$4,677,000;

195,000 acres of oats, 5,946,000 bushels, value \$3,032,000; 9000 acres of turnips, 3,346,000 bushels, value \$1,271,000; 64,000 acres of buckwheat, 1,782,000 bushels, value \$962,000. The total area under field crops in 1914 was 904,055 acres and the value of the product was \$20,045,000. The climate is rather too severe for the large fruits, except in certain regions like the valley of the St. John, where the hardier varieties are successfully grown. The smaller fruits, however, are abundant, and, ripening late, are put on the New England market at monopoly prices. The situation of the province on the seaboard gives it a marked advantage in marketing produce.

Considerable attention is given to the raising of sheep, and more especially cattle, and in very recent years there has been a decided growth in the dairy industry. In 1913 there were 65,103 horses, 106,904 milch cows, 107,864 other cattle, 135,115 sheep, and 77,014 swine. In 1910 there were 42 butter factories and creameries, producing 1,166,243 pounds of cheese and 849,633 pounds of butter. Fox farming attained considerable proportions in 1913. At the close of that year there were 40 fox ranches in the province, and a large number of companies were incorporated. Silver-black foxes are imported from Alaska (see FUR FARMING). The province has government experimental farms and agricultural schools.

Manufacturing, Transportation, and Commerce. Dominion, provincial, and municipal aid has greatly facilitated the construction of railways, the mileage for all lines aggregated 1545 miles in 1913. There were in 1913 about 600 miles of railway under construction. The Canadian Pacific connects the province with the railroad systems west by running west from St. John and crossing the State of Maine. The Intercolonial enters the province from Quebec on the north and traverses the east side of the province, one branch connecting with St. John. The National Transcontinental, the eastern section of the Grand Trunk Pacific Railway, runs from Moncton westerly and northwesterly through the province and thence to Quebec and Winnipeg. The position of New Brunswick on the Atlantic coast, and the large number of excellent harbors, greatly favor its commercial advantage. The foreign trade of the province passes through the port of St. John. The winter port business of the city in 1912-13 was 407,829 tons. Regular ship lines connect this port with Atlantic coast points to the south and with European countries. The trade of the province for the fiscal year 1913 was \$34,634,156 in exports and \$14,445,811 in imports. Lumber is the chief article of export. The manufacture of lumber and of lumber products leads the manufacturing industries. Shipbuilding, which was formerly important, has greatly declined. The manufacture of wood pulp, on the other hand, is assuming large proportions, and the future of the industry is assured, because the supply of spruce—the wood used for this purpose—is practically inexhaustible. In 1911 the province had 1158 manufacturing establishments, with an invested capital of \$36,125,012, employing 24,755 hands, with salaries and wages amounting to \$8,314,212, and an output valued at \$35,422,302 as compared with an output in 1905 valued at \$22,133,951.

Government and Finance. The administration of the government is in the hands of a Lieutenant Governor and an executive council.

The council, of which the Premier is the chief, is responsible to the Legislative Assembly, composed of 46 members elected for four years. The Legislative Council was abolished in 1892. In striking contrast to some other Canadian provinces, there are no local municipal councils, the municipal affairs being managed by a county council. In this council each parish has two representatives, who serve without emolument (except in the County of Carleton), the term of office being one year. The various parish officers receive their appointments from the county council. The net debt of the province in 1912 was \$4,693,457. The expenditures for 1913 amounted to \$1,459,122 and the receipts to \$1,446,962. Nearly half the receipts came from the Dominion subsidy, the timber licenses being next in importance. Of the ordinary expenditures, \$273,189 were devoted to education and \$383,363 to public works. Taxes are levied by the province upon telegraph, telephone, and insurance companies and banks. There is also a succession duty upon estates. Local expenditures are met by taxes collected upon real and personal property, income, and polls. Property is rated at its full value. The capital of New Brunswick is Fredericton.

Population. There is a high birth rate in the province, but also a rather large emigration. The censuses for 1891, 1901, and 1911 gave, respectively, 321,263, 331,120, and 351,889. There is a small French element. The great bulk of the population is of British origin, the Irish especially being well represented. St. John had a population of 42,511 (1911). 1915 (local est.), nearly 70,000. Moncton in 1911 had a population of 11,345, and Fredericton 7208.

Religion. The Roman Catholics number more than one-third of the total religious membership of New Brunswick, their number in 1911 being 144,889. Among the Protestants, the Baptists, according to the census of 1911, are strongest (82,106), followed by the Anglicans (42,864), Presbyterians (39,207), and Methodists (34,558).

Education and Charities. Educational affairs are in the hands of a superintendent of education and an educational council. Unlike Quebec and Ontario, the province does not provide for separate denominational schools. There is uniformity of methods, textbooks, etc., throughout the province. Attendance is compulsory. One in every 5.53 of the population is enrolled in the public schools, the proportion between the grammar and the elementary enrollment being about 1 to 60. In 1912-13 the number of public schools was 1897, teachers, 2003; pupils, 63,580, with boys and girls about equal in number; average daily attendance, 43,624; female teachers, 1810; male, 193. The province maintains normal schools and provides for higher education at the University of New Brunswick at Fredericton. The religious denominations maintain seminaries and universities, of which Mount Allison University (Methodist) at Sackville is the largest. The University of St. Joseph at Memramcook is a Roman Catholic institution. The expenditure for educational purposes shows a steady increase from \$413,967 in 1888 to \$955,224 in 1913.

Of the charitable institutions, the asylums for the insane constitute the greatest item of expenditure. The province supports also, in whole or part, a general hospital (at St. John), a boys' industrial home, a country home or shelter

for children, and deaf and dumb institutions. Private and sectarian interests are well represented in charitable work. Convicts sentenced to penal life are sent to the Dominion penitentiary at Dorchester.

History. The first European settlement was made on the Bay of Chaleur by Frenchmen in 1639, and in 1672 further settlements were made on the Miramichi River and along the coast. With Nova Scotia, New Brunswick formed the original French colony of Acadia or New France, which was taken by the English in 1654, restored to France in 1667, but re-ceded to the English in 1713 by the Treaty of Utrecht, although disputes as to the boundaries lasted until the Treaty of Paris in 1763 finally settled the question in favor of the British. The first British settlements were made by Scottish agriculturalists and laborers along the Miramichi in 1764. In 1783 over 5000 United Empire Loyalists from the United States settled in the colony. In 1784 Nova Scotia and New Brunswick separated to form distinct colonies, and in January, 1786, the first Legislative Assembly of New Brunswick met at St. John. In 1848, after prolonged struggle, responsible government was established. In 1867 New Brunswick united with Ontario, Quebec, and Nova Scotia, and thus became one of the original provinces of the Dominion of Canada. After Confederation an agitation arose for full, undenominational public schools, which were established by law in 1871. The Roman Catholics strongly opposed this law, but were induced to accept a compromise in 1875. The course of provincial history thereafter followed local issues, and Liberal and Conservative administrations alternated according to the success or failure of the appeal for popular support upon those issues. The most noteworthy events were the Supreme Court of Judicature Act, establishing a court with three trial divisions (1906); the creation of a Public Utilities Commission, with three commissioners, for the regulation of rates and services of any public utility (1910); the destruction of the town of Campbellton by fire in the same year, and the various legislative measures for developing new railways and the natural resources of the province. Local option in regard to the liquor traffic is in force in several counties.

Dawson, *Descriptive Sketch of the Physical Geography and Geology of the Dominion of Canada* (Montreal, 1884); A. B. Willmott, *The Mineral Wealth of Canada* (London, 1898); William Kingsford, *History of Canada* (London, 1887-98); M. H. Perley, *On the Early History of New Brunswick* (St. John, 1891); James Hannay, *History of New Brunswick* (St. John, 1909).

NEW BRUNSWICK. A city and the county seat of Middlesex Co., N. J., 31 miles southwest of New York, at the head of navigation on the Raritan River, about 15 miles from its mouth, and on the Pennsylvania and the Raritan River railroads (Map New Jersey, D 3). It is the eastern terminus of the Delaware and Raritan Canal. A magnificent railway bridge spans the river at this point. The city has a large public library and also the Voorhees and the Gardner A. Sage libraries, and is the seat of Rutgers College (q.v.), of the Theological Seminary of

the Dutch Reformed church in America, and of the State Agricultural and Mechanical College with the State model farms; and there are three hospitals and 229 acres of public parks. New Brunswick is extensively engaged in manufacturing, the chief products being hosiery, wall paper, automobiles, musical strings, rubber boots and shoes, bicycle and automobile tires, surgical and medical supplies, chemicals, fruit jars, boilers, cigars, foundry products, knitting needles, linoleum, washing bluing, sash and blinds, shoes, etc. The city is governed by the commission form of government. A commission of five men elected by the people for a term of four years, gives a direct administrative head to five departments, which cover all branches of the city government, excepting the board of education, which board is appointed by the mayor and is held absolutely responsible for the educational affairs of the city. The water works are owned and operated by the municipality. Pop., 1900, 20,006; 1910, 23,388; 1914 (U. S. est.), 24,827. The first settlement here was made in 1681. The place was first called Prigmore's Swamp (1681-97), then Inan's Ferry (1691-1714), and finally New Brunswick, in honor of the house of Brunswick. New Brunswick was incorporated as a town in 1736 and was chartered as a city in 1784. It suffered much during the Revolution, and during the winter of 1776-77 was occupied by the British.

NEW BRUNSWICK THEOLOGICAL SEMINARY. See THEOLOGICAL SEMINARY OF THE REFORMED CHURCH IN AMERICA.

NEWBURGH. A city in Orange Co., N. Y., 60 miles north of New York City, on the Hudson River, about 5 miles above the picturesque Highlands, on the Erie and the West Shore railroads, and on the lines of several steamship companies (Map: New York, A 1). It is built on a steep, terraced slope, rising about 300 feet above the river to an extended plateau. The city has a public library, two public parks, St. Luke's Home and Hospital, Home for the Friendless, Home for Children, and a county tuberculosis sanatorium. Among noteworthy buildings are a beautiful Masonic Temple, Y. M. C. A. building, and the Broadway School. The river here expands into Newburgh Bay, giving the city a deep water front and facilities for traffic by water. There is a trade in agricultural and dairy products, and large quantities of coal from Pennsylvania are here transferred to barges and coasting vessels. Newburgh is of considerable importance as an industrial centre, having manufactories of cottons, woolens, silks, paper, felt hats, baking powder, soap, paper boxes, brick, plush goods, steam boilers, tools, waterway gates, ice machines, pumps, moving-picture screens, overalls, perfumes, furniture, carpets, carburetors, spiral springs, spiral pipe, shirt waists, shirts, felt goods, lawn mowers; shipyards; foundries and machine shops; tanneries; leatherette works; plaster works. It is also a popular resort, being visited by thousands of New Yorkers during the summer months. Of particular interest is Orange Lake with its recreation park. The city has adopted Plan C of the Optional Charter Law of New York State. This provides for a mayor and four councilmen elected for four years. The executive power is vested in a city manager, who is appointed by the council. The water works are owned and operated by the municipality. Pop., 1890, 23,087; 1900, 24,943; 1910, 27,805; 1914 (U. S.

est.), 29,023. The first settlement at Newburgh was made in 1709 by German Lutherans from the Rhemish Palatinate, who named it the Palatine Parish by Quassaic. By 1750 most of the Germans had been replaced by people of English and Scottish descent, who in 1752 changed the name to the Parish of Newburgh (after Newburgh, Scotland). Newburgh was the headquarters of the American army from March, 1782, until the latter part of 1783, and it was here that the Newburgh Letters were circulated, that the army was disbanded, and that Washington received the famous Nicola letter proposing that he become King. The Hasbrouck house, then occupied by Washington, is now owned by the State and used as a museum for Revolutionary relics. On the grounds is the Tower of Victory, an imposing stone structure erected by the United States and State governments to commemorate the close of the war. Newburgh was incorporated as a village in 1800 and was chartered as a city in 1865. Consult E. M. Ruttenber, *History of Orange County with History of the City of Newburgh* (Newburgh, 1876), J. J. Nutt, *Newburgh. Her Institutions, Industries, and Leading Citizens* (ib., 1891), L. P. Powell (ed.), *Historic Towns of the Middle States* (New York, 1899).

NEWBURGH, WILLIAM OF. See WILLIAM OF NEWBURGH.

NEWBURGH ADDRESSES. Two anonymous letters that appeared in 1783, after the close of the Revolutionary War. They urged some organized action to redress the wrongs of American soldiers, especially the withholding of their pay, and were later found to have been written by Gen. John Armstrong.

NEWBURN. A town in Northumberland, England, on the Tyne, $5\frac{1}{2}$ miles west of Newcastle. Pop., 1901, 12,600; 1911, 17,155.

NEWBURY. A municipal borough and market town in Berkshire, England, on the Kennet and on the Kennet and Avon canal, 17 miles west-southwest of Reading (Map: England, E 5). It has fine municipal buildings. Trade in agricultural produce and malting are the principal industries, and an annual wool market is held. The chief buildings are the church, built in the reign of Henry VII, and the Corn Exchange. The town owns real estate, markets, and the gas works. It dates from the Roman period, and was a gift of the Conqueror to Ernulf de Hesdin. Newbury is best known for two hard-fought battles between the Royalists and Parliamentary forces in September, 1643, and in October, 1644. On the battle field is a handsome memorial to Lords Falkland, Sutherland, and Carnarvon, Royalists, who fell there. Pop., 1901, 11,061, 1911, 12,107. Consult W. Money, *History of Newbury* (Oxford, 1887).

NEWBURYPORT. A city, including several villages, a port of entry, and one of the county seats of Essex Co., Mass., 38 miles by rail northeast of Boston, on the Merrimac River and on the Boston and Maine Railroad (Map: Massachusetts, F 1). Among the city's noteworthy buildings and objects of interest are the public library of 40,000 volumes, Marine Museum, Putnam Free School, Anna Jaques Hospital, Old Ladies' Home, the Old South Church, containing the remains of George Whitefield, the house in which William Lloyd Garrison was born, the Dexter House, a statue of Washington, Washington Park, and a suspension bridge. The

harbor, opening into the Atlantic Ocean, is safe and spacious. The principal manufactured products include boots and shoes, cotton cloths, silverware, machinery, and combs. Shipbuilding was formerly a very extensive and important industry. Newburyport is also a distributing centre for coal. Under the original charter of incorporation of 1851, the government is administered by a mayor, annually elected, and a bicameral council, of which the Upper House is elected on a general ticket and the Lower by wards. The municipality owns and operates the water works. Pop., 1900, 14,478; 1910, 14,949; 1914 (U. S. est.), 15,147.

Newburyport, settled about 1635, was a part of Newbury until 1764, when it was separately established and incorporated as a town, and was chartered as a city in 1851. It was the home of Theophilus Parsons and the birthplace of Francis C. Lowell, who introduced cotton manufacturing on a large scale into the United States. Consult: Smith, *History of Newburyport, Mass.* (Boston, 1854); D. H. Hurd, *History of Essex County, Mass.* (Philadelphia, 1888); J. J. Currier, *History of Newburyport* (Newburyport, 1906).

NEW CALEDONIA, kâl'è-dô'nî-â. An island in the Pacific, belonging to France, the southernmost of the Melanesian Islands. It is situated 1200 miles southeast of New Guinea, 850 miles from the coast of Queensland, and about the same distance from New Zealand (Map. Australasia, J 5). It is elongated in shape, extending from northwest to southeast, with a length of 240 miles, an average width of 30 miles, and an area of 7650 square miles. It is almost entirely surrounded by a coral reef, which is 5 to 15 miles from the shores and affords a belt of well-protected navigable water inside. The coast itself is indented with numerous bays, forming, especially on the southwestern side, many excellent harbors. The interior is essentially mountainous, although of no great height. There are two parallel ranges running the entire length of the island and inclosing the valley of the Diahat, the only river of importance. They are of nearly uniform height, except in the south, where they are broken by marshy lowlands. The highest point is an unnamed peak near the northwest coast, with an altitude of about 5387 feet. Mount Humboldt in the southeast is 5360 feet high. The northeast consists of Archæan rocks; along the west coast is a narrow band of Triassic and Cretaceous strata; while eruptive rocks, principally serpentine, cover two-thirds of the island. There are no active volcanoes, but some evidences of ancient volcanic activity, including thermal springs.

The proverbially healthful climate is both drier and cooler than that of the other Melanesian Islands. A rainy season obtains from December to May and a comparatively dry and cool season the rest of the year, although no month is rainless. The rainfall (70 inches) is sufficient to sustain a very rich flora, although large areas are semiarid pine barrens in which the *Araucaria cookii* is prominent. True forests appear chiefly in the northern part and contain much valuable timber, though sandalwood has now practically disappeared. The fauna, like that of all other Oceanic islands, is very poor in varieties, a single species of bat being probably the only indigenous mammal, while reptiles are also few. The avifauna is the richest and is

related to that of the Australian continent rather than to that of New Zealand. The natives of New Caledonia, whom the French style Canaques (Kanakas), are Melanesians, probably of mixed (Papuan-Polynesian) type. The coast tribes seem to be better shaped and more regularly featured than the rest. They are above the average in stature, with dolichocephalic head form. The absence of large animals on the island has made them practically vegetarians, but it may account in part for the cannibalism which once prevailed in this part of the world. One of their most interesting institutions is the pilu-pilu, or yam-harvest dance, with its mock fight. Something like the Druk Society of New Britain exists among them. Among other things worthy of note are their beehive huts, grotesque carvings of heads, and slingstones. The bow seems to be little employed, the spear and club being preferred. In many of the mountain valleys are found remains of terraced plantations which have been mistaken for aqueducts; their purpose was not so much to lead water upon the soil as to prevent the heavy flow of the rains from washing the soil away; many old terraces remain in use, and new are built as need arises. Numerous petroglyphs and rock carvings exist, some of which are considered pre-Kanaka. Since New Caledonia has been made a French penal colony, some admixture between the Europeans and the native women has taken place. Some of the tribes of the interior are still little known. The Webias of central New Caledonia, who still live in a state of independence and have not yet been seriously influenced by the whites, are said to be good-natured people and skillful fishermen. As in many of the Pacific islands, the natives are diminishing in number.

The natives are the best agriculturists of all the Oceanic tribes. They have succeeded even better than the white farmers, as the latter have been embarrassed for lack of labor, though they have imported Chinese and New Hebrides islanders. The natives live on reservations from which whites are excluded, but they are rapidly decreasing in number—50 per cent in the last 50 years. The chief agricultural products are coffee, maize, tobacco, sugar, copra, cassava, grapes, and pineapples. Wheat and cotton have also been introduced. The mineral wealth is considerable, including gold, silver, lead, copper, nickel, cobalt, chromate of iron, and coal, and these are worked mainly by Japanese miners. The last six are mined, and the nickel output is the most valuable, amounting in 1911 to 120,059,297 metric tons. The commerce is considerable. The exports in 1913 were valued at \$3,082,000 and the imports at \$3,447,000, the mineral exports amounting to \$989,311. Of the exports, the principal are minerals, canned meats, and coffee. A railroad is under construction from Nouméa, the capital, to Bourail (90 miles). Nouméa is a municipality and the chief port of the island. It is in regular steamship communication with Sydney, New South Wales, having a good harbor, pier, and repairing slip. There are primary schools and a secondary school, a perfumery and a meat-canning factory.

The island with its dependencies, the isles of Pines, Wallis, Futuna, and Alafi, and the Huon and Loyalty Islands, is administered by a governor, who is assisted by a privy council of eight members, and there is an elective legisla-

tive body. Until 1896 the colony was chiefly used as a penal settlement, and convicts constituted the majority of the white inhabitants. Since that date no convicts have been sent, and the convict population is rapidly decreasing. In 1912 the population was 50,608, of whom 13,138 were free, 5671 were originally convicts, and 28,075 were aborigines. Immigration from France is slight, the majority of new settlers coming from Java, Tonkin, India, and other Pacific islands.

The island was discovered by Cook in 1774. In 1843 the French flag was raised, but the act was disavowed, owing to protests from England. Ten years later, however, the French took formal possession in order to put a stop to the cannibalism and excesses committed by the natives. In 1864 the penal settlement was founded, and after the Franco-Prussian War thousands of Communists were deported hither. The natives have always been suspicious of the whites and in 1878 and 1881 rose in revolt, massacring many of the colonists.

Anderson, *Fiji and New Caledonia* (London, 1880); Alfred Schreiner, *La Nouvelle-Calédonie depuis sa découverte jusqu'à nos jours* (Paris, 1882); León Vallée, *Essai d'une bibliographie de la Nouvelle-Calédonie et dépendances* (ib, 1885); G. Griffith, *In an Unknown Prison Land: An Account of Convicts and Colonists in New Caledonia* (London, 1901); J. B. Alberti, *La colonisation à la Nouvelle-Calédonie* (Paris, 1909).

NEW CANAAN. A town, including a village of the same name, in Fairfield Co., Conn., 8 miles by rail northeast of Stamford, on Five Mile River and on the New York, New Haven, and Hartford Railroad (Map Connecticut, A 5). It contains the Brooks Sanitarium, the B. P. Mead Memorial Park, and attractive town hall, school, and library buildings. There is also a shirt and overall factory. New Canaan is known chiefly as a summer resort, having splendid scenery and a number of facilities for sport. Pop., 1900, 2968; 1910, 3667.

NEW CASTLE, kās-tél'. The southern part of Castile (q.v.).

NEWCASTLE, nū-kās'l. A city of New South Wales, situated at the mouth of the Hunter River, 102 miles north-northeast of Sydney, with which it is connected by rail and by steamers (Map: New South Wales, F 3). It is a well-built town with paved streets and fine public buildings. It is the see of an Anglican bishop, whose cathedral of Christ Church is a notable building, as are also the library and art school, the school of mines, and the Victoria Theatre. It is the principal port for the northern part of New South Wales and is the greatest coaling port in the Southern Hemisphere. Large quantities of wood are also shipped from this port. In 1912 the total amount of tonnage entered and cleared at Newcastle was 3,966,255. Vessels of 4000 tons can be berthed, the greater portion of the wharfrage, with that at Carrington, some 5 miles in extent, belonging to the government, which has provided ample shipping appliances, in the shape of four steam cranes—two of 25 tons, six of 15 tons, and four of 9 tons—as well as a number of chutes. There are three patent slips, one of which is capable of taking up vessels of 1000 tons, and a floating dock that can lift 2000 tons. The area of the harbor, which is defended by two forts and has two breakwaters,

is 540 acres. The width of the channel at the entrance of the harbor is 1200 feet, and the depth of water on the bar 25½ feet and of the harbor 27 feet at high and 23 feet at low water. The industries of Newcastle include a steam biscuit factory, copper-smelting works, a brewery, shipbuilding yards, foundries, carriage factories, and boot factories. There is also a large trade in frozen mutton. Newcastle is the seat of a United States consul and owns its gas and electric-lighting plants. The water supply is controlled by the Hunter River Water Supply and Sewerage Board, which took over the control and management of the water supply from the government on July 1, 1892. Pop., 1901, 14,250; 1911, 14,405; with suburbs, 1913, 57,650.

NEWCASTLE. A town, port of entry, and the county seat of Northumberland County, New Brunswick, Canada, situated on the left bank of the Miramichi River, at the head of deep-water navigation, and on the Intercolonial Railway, 77 miles northeast of Moncton by rail (Map: New Brunswick, D 1). It contains the county buildings, customhouse, an academy, and a Roman Catholic convent, is a lumbering centre, with several large saw mills, and manufactures sashes and doors, chairs, and wagons. The surrounding district is widely known for moose hunting and salmon fishing. Pop., 1901, 2507, 1911, 2945; 1915 (local est.), 3100.

NEW CASTLE. A city in New Castle Co., Del., 6 miles by rail south of Wilmington, situated on the Delaware River, at the head of Delaware Bay, and on the Philadelphia, Baltimore, and Washington Railroad (Map: Delaware, H 1). New Castle has a good harbor and regular steamship connection with Philadelphia and Baltimore; is the centre of an agricultural and fruit-growing region, has large shad-fishing interests, and manufactures steel castings and cotton gloves. The city possesses several buildings of historic interest, a public library, and two parks. Settled by Swedes in 1640, New Castle was held successively by the Swedes, Dutch, and English, and was the landing place of William Penn in 1682. It was incorporated first in 1875. Pop., 1900, 3380; 1910, 3351.

NEW CASTLE. A city and the county seat of Henry Co., Ind., 44 miles by rail east-northeast of Indianapolis, on the Blue River, and on the Cleveland, Cincinnati, Chicago, and St. Louis, the Fort Wayne, Cincinnati, and Louisville, and the Pittsburgh, Cincinnati, Chicago, and St. Louis railroads (Map: Indiana, G 5). The city is surrounded by a farming district and is an industrial centre of importance. The leading manufactures include sheet iron and steel, automobiles, caskets, clothing, scales, bridges, pianos, furniture, handles, shovels, lathes, bricks, flour, etc. The Indiana Village for Epileptics, comprising 1245 acres, is 2 miles north of the city. New Castle owns its water works and electric-lighting plant. Pop., 1900, 3406; 1910, 9446; 1914 (U. S. est.), 12,017.

NEWCASTLE. A city and the county seat of Lawrence Co., Pa., 50 miles by rail northwest of Pittsburgh, at the junction of the Shenango and Neshannock rivers, and on the Erie, the Pennsylvania Company, the Pittsburgh and Lake Erie, the Baltimore and Ohio, and the Buffalo, Rochester, and Pittsburgh railroads (Map: Pennsylvania, A 4). It is the commercial centre of a fertile agricultural region, which has also rich deposits of bituminous coal, lime

stone and sandstone, fire clay, and iron ore. As a manufacturing city it ranks sixth in the State, its industrial importance being dependent upon the metal-working establishments, chief among which are the steel and rolling mills, blast furnaces, tin-plate and terneplate mills, and the car-construction shops. Other plants include large cement works and manufactories of pottery, wire novelties, tin cans, boxes, drugs and chemicals, hosiery, paints, boilers, machinery, lumber products, rubber tires, radiators, etc. The city maintains an old ladies' home, two hospitals, a public library, fine courthouse and high-school buildings, and Cascade Park, a beautiful place of resort, owned by the traction company. Settled in 1812, Newcastle was chartered as a city in 1869, and adopted the commission form of government in 1914. Pop., 1900, 28,339; 1910, 36,280; 1914 (U. S. est.), 39,569.

NEWCASTLE, HENRY PELHAM FIENNES PELHAM CLINTON, fifth DUKE OF (1811-64). An English statesman. He was educated at Eton and at Christ Church, Oxford, and represented South Nottinghamshire in Parliament from 1832 to 1846, when he was ousted by the influence of his father, the fourth Duke, for supporting Sir Robert Peel in his free-trade measures. In the brief Conservative administration of 1834-35 he had been a Lord of the Treasury, and First Commissioner of Woods and Forests in the Peel administration, from 1841 to 1846. He was then made Chief Secretary to the Lord Lieutenant of Ireland, but went out of office with his chief a few months afterward. He succeeded to the dukedom in 1851 and returned to office in 1852, filling the post of Secretary of State for the Colonies (which formerly included the Department of War) in the Aberdeen government. The war with Russia broke out, and in June, 1854, it was found necessary to create a Secretary of State for War, and the new office was assigned to Newcastle. He resigned as a result of an investigation into the suffering of the army at Sebastopol. Newcastle was reappointed Secretary of State for the Colonies in the second administration of Lord Palmerston, 1859, and served until 1864. In 1860 he accompanied the Prince of Wales during a tour in Canada and a portion of the United States, and on his return received the Order of the Garter from the Queen. Consult John Martineau, *The Life of Henry Pelham, Fifth Duke of Newcastle* (London, 1908).

NEWCASTLE, MARGARET, DUCHESS OF. See CAVENDISH, MARGARET.

NEWCASTLE, THOMAS PELHAM-HOLLES, first DUKE OF (1693-1768). An English officeholder. He was educated at Westminster School and for a short time attended the University of Cambridge. He was one of the largest landholders in the realm, was created Duke of Newcastle-on-Tyne in 1715, in 1724 he became Secretary of State for the southern department in Walpole's coalition administration and, in spite of his amazing incompetency, was continued in this office until 1754, when he became Prime Minister. He was in power at the beginning of the hostilities of the Seven Years' War (q.v.), but affairs were mismanaged completely, and in November, 1756, Newcastle resigned. Pitt now took charge of the war and foreign affairs. In 1757 a Newcastle-Pitt ministry was formed, Pitt being the virtual head. In 1762 Newcastle was forced out of office by

Lord Bute and thereafter was of little importance, though during the short Rockingham administration, formed in 1765, he filled the office of Privy Seal. He died Nov. 17, 1768. Consult: William Coxe, *Memoir of the Administration of . . . Henry Pelham* (London, 1829); P. H. S. Stanhope, *History of England from the Treaty of Utrecht to the Treaty of Versailles, 1713-83* (ib., 1851-54); W. E. H. Lecky, *History of England in the Eighteenth Century* (ib., 1878-90).

NEWCASTLE, WILLIAM CAVENDISH, DUKE OF. An English statesman. See CAVENDISH, WILLIAM, DUKE OF NEWCASTLE.

NEWCASTLE-UNDER-LYME, -līm. A parliamentary and municipal borough in Staffordshire, England, 15 miles north-northwest of Stafford (Map: England, D 3). Its chief buildings are the town hall and high school, with which is incorporated the free grammar school, founded in 1602. The quaint red-sandstone tower of the restored parish church of St. Giles dates from the twelfth century. It has an art school and a library. The town has greatly improved in modern times, it owns remunerative real estate, gas, markets, and maintains a sewage farm, cemetery, and isolation hospital. Hats were formerly the principal branch of manufacture, but the making of army clothing is now the chief industry. Newcastle-under-Lyme is surrounded by famous potteries, coal mines and ironworks are also in the vicinity. There are also manufactures of cotton, leather, paper, and malt. Of Saxon origin, the town was named after a castle built by Henry I under the great forest of Lyme. The town received its first charter from Henry II in 1175. Pop. 1901, 19,914; 1911, 20,201.

NEWCASTLE-UPON-TYNE, -tīn. A city and a county borough of England, county town of Northumberland, on the left bank of the Tyne, 8 miles from its mouth and 272 miles by rail north by west of London (Map: England, E 1). The town stands partly upon an elevated plateau and partly upon the north bank of the river. The river is crossed by four bridges, which connect Newcastle with Gateshead (q.v.)—the old high-level bridge (1849), the Redheugh suspension bridge (1871), an hydraulic swing bridge (1876), and the new high-level (railway) bridge (1906). The old high-level bridge is one of the engineering triumphs of Robert Stephenson. The length of the viaduct is 1337 feet, and the height of the railway above high water 112 feet. The bridge has a broad carriageway, by which the ordinary traffic avoids the precipitous streets on both sides of the river, with passenger paths on each side, and the railway above.

Some of the modern streets are handsome and spacious, especially Grey Street, which presents a scheme of Grecian architecture, and Grainger Street. The church of St. Nicholas, forming the cathedral of the diocese of Newcastle, is a noble edifice, chiefly in the Decorated style, though its leading feature is the Perpendicular lantern tower. Other old churches are St. Andrew's (damaged by the Parliamentarians in 1644) and St. John's. Among modern churches are St. George and the Roman Catholic cathedral. In the Guildhall, an old and somewhat inconvenient building, situated beside the river, the town assizes are opened and the quarter sessions held. Under the Guildhall proper there is an exchange for the merchants, ship-

owners, and brokers of the quayside. In the Moot Hall, a modern, handsome Grecian building overlooking the swing bridge, the town and county assizes are held. The spacious town hall, a modern building, stands on a block of ground facing St. Nicholas' Church; associated with it are a corn market and offices for the transaction of the town business. The market for the sale of meat and vegetables is one of the most spacious and commodious in the Kingdom. All the railways entering the town terminate in a large station near its centre. The jail, a heavy and costly building, occupies a low and confined situation. The postal and telegraph office is one of the largest and finest of the public buildings in the town. There are two theatres—the Royal (the ornament of Grey Street) and the Tyne Theatre in Westgate Street. Among the educational institutions are a public library, a literary and philosophical society, a society of antiquaries, a natural-history society (with museum), a mechanics' institute, and an institute of mining engineers. The colleges of medicine and science are both affiliated with Durham University. A column surmounted by a statue of Earl Grey, to commemorate the passing of the Reform Bill, and a bronze statue to George Stephenson are the principal monuments in the city.

Of benevolent institutions there are several hospitals, an eye infirmary, a dispensary, asylums for the blind, the deaf and dumb, two orphanages, etc. The municipal property consists of real estate, markets, street railways, and quays. The municipality maintains baths, washhouses, free libraries, cemeteries, and dust destructors, and indirectly contributes to technical education, important domestic utilities, such as gas, water, etc., are provisionally monopolized by companies. Extensive improvements have modernized the older portions of the town, and the streets generally are well paved and well lighted. The trade of Newcastle consists largely in coal from the Northumberland and Durham regions, of which it is the great centre. Large quantities of lead, the produce of the mines of Alston Moor and Weardale, are brought to Newcastle for manufacture, and a large quantity of unrefined lead is also imported from Spain.

At Newcastle the railway system had its origin, and its locomotive and engineering works are among the largest in England. The ordnance works of Lord Armstrong situated at Elswick, the western part of Newcastle, are well known. Here steel shipbuilding and various branches of engineering are extensively carried on, and since 1882 many warships have been constructed on the Tyne. Newcastle occupies an important position in the manufacture of soda, bleaching powder, vitriol, salt, and other chemical products. Earthenware is largely manufactured, and glass staining has reached great perfection. The fire-brick trade has attained large proportions, and there are important manufactures of gas retorts and fire-clay pipes, which are sent all over the world. Immense numbers of grindstones are exported. Portland and other cements are manufactured in vast quantities.

The river Tyne from the sea to Newcastle forms a natural dock for the accommodation of shipping, and for 10 miles both banks are lined with quays and factories. It has four natural docks, the largest nearly a mile long and in-

cluding two piers at its mouth. Large sums have been spent on the improvement of the Tyne. The entrance and many parts of the river have been deepened by dredging. The net tonnage of vessels entered and of vessels cleared at Newcastle, together with North and South Shields, was 3,897,142 and 4,894,157 in 1900, 5,022,250 and 6,128,928 in 1910, and 6,421,195 and 7,632,672 in 1912. At Newcastle and North and South Shields imports and exports in 1900 were valued at £10,108,716 and £11,994,740 respectively; in 1910, £9,442,944 and £11,308,177, in 1912, £10,043,427 and £10,718,200 (£10,694,596 United Kingdom produce, £23,604 foreign and colonial produce). Exports consist chiefly of coal, iron, copper, lead, alkali, and machinery, imports comprise fruits, grain, butter, sugar, metals, petroleum, etc. Newcastle is the seat of a United States consul.

Newcastle dates from the Roman Pons Ælii—one of the chain of forts by which the wall of Hadrian was fortified. On the withdrawal of the Romans the deserted camp became the residence of a colony of monks, and the town was called Monkchester. Robert, eldest son of William the Conqueror, began to build a castle here in 1079 or 1080. Hence the modern name of Newcastle. William Rufus finished his brother's castle, surrounded the town with a wall, and gave the inhabitants special privileges. The present castle, which displays better than any other in England the genius of Norman military architecture, was erected by Henry II between the years 1172 and 1177. Newcastle, being made the rendezvous of the vast armaments which the first three Edwards led into Scotland, was in their time surrounded with new walls of unusual strength and magnitude; portions of them yet remain. During the Civil War it declared for the King and sustained a 10 months' siege by the Scots. The coal trade dates from the reign of Henry III. In 1615, 400 colliers cleared the port, one-half to supply London. Lords Stowell, Eldon, and Collingwood, Mark Akenside, and Hutton, the mathematician, were natives of Newcastle. Intimately connected with it, though not born in it, were Thomas Bewick, the engraver, Robert Morrison, the Chinese scholar, and George and Robert Stephenson. Pop., 1801, 28,400, 1851, 87,800, 1901, 247,023, 1911, 266,671. Consult D. B. Rendel, *Newcastle-on-Tyne: Its Municipal Origin and Growth* (London, 1898).

NEW CHURCH. See SWEDENBORGIANISM.

NEWCHWANG, or **NIUCHWANG**, nu'-chwang' (the cattle mart). One of the treaty ports of Manchuria, China, situated in the Province of Shingking, 10 miles from the mouth of the Liao River, which falls into the Gulf of Pechili, and on the southern branch of the Chinese Eastern Railway, which is now controlled by Japan, and which formerly was associated with the Russian Trans-Siberian system (Map China, M 3). In commercial importance the port is a rival to Dairen (Dalny), but has not been so much favored by the Japanese as the latter. For a long time Newchwang was the port of entry for south Manchuria, and was without competition until the development of Dairen first by the Russians and later by the Japanese. The vicinity of Newchwang is not very productive agriculturally, but important coal mines have been opened along the railway line, and the city acquires additional importance from its railway connection with

Tientsin and Peking. The chief exports are beans, bean cake, and oil, which go largely to Japan, and also skins, mats, and cured fish. Imports consist mainly of cotton goods, petroleum, sugar, flour, coal, and matches. In 1913 foreign imports amounted to 16,050,514 hk tls, native imports to 9,733,593 hk. tls., and net exports to 24,480,087 hk. tls.

Formerly Newchwang was situated at the mouth of the Liao River, but has retreated inland through the silting of the coast. Thus, what is commercially known as Newchwang is in reality the port of Yingkow, or Yingtse (also known as Port Newchwang), at the mouth of the Liao, population 61,000. This port of Newchwang, which has consular representatives, was taken by the Japanese in 1895, and was originally a part of the territorial concessions of China, but Japan was forced to relinquish it. During the Boxer uprising in 1900 Newchwang was occupied by Russia, from whom it was taken by the Japanese in 1904 during the Russo-Japanese War (qv). At present (1915) the Japanese have virtual control through their domination of the southern part of the Manchurian territory.

NEW COLLEGE. A college at Oxford, England, originally known as the College of St Mary of Winchester. It was founded by William of Wykeham, Bishop of Winchester, and sometime Lord Chancellor of England, in 1379 for a warden, 70 fellows and scholars, 10 chaplains, 3 clerks, and 16 choristers. The college was but a part of Wykeham's plan, which included also the establishment of the famous school at Winchester, the first of the English public schools, from whose numbers the scholars of New College were to be chosen. To this new feature in English education was added also the beginning of a tutorial system in the college, by which the ordinary university instruction was supplemented by the work of the fellows of the college with the younger scholars. In the buildings of his college Wykeham founded the school of English college architecture, and the buildings remain to-day the finest of the early colleges. In every way this foundation was the most splendid of its time, but, owing chiefly to certain curious exemptions from university supervision in examinations (cf King's College, Cambridge), it did not play the part that might have been expected of it during most of its history. Here Vitelli taught Greek, and thus gave the college a very real connection with the new awakening. It is to-day, in scholarship and athletics, one of the leading colleges in Oxford. The establishment, as fixed by statutes of 1855 and 1881-82, consisted in 1912-13 of a warden, 32 fellows, 3 honorary fellows, 2 chaplains, 40 scholars, college officers, and a choir, with a total of some 300 undergraduates. The connection with Winchester School is still closely maintained. The buildings are of great beauty, particularly the hall and the chapel, with windows designed by Sir Joshua Reynolds, and an imposing tower. The gardens, which include in their limits part of the old city wall of Oxford, are among the most attractive in Oxford. The college presents to 40 livings. Among the worthies of New College have been Archbishop Chichele, founder of All Souls' College, Bishop Waynflete, founder of Magdalen College, Bishops Ken and Lowth, and Sydney Smith. See KING'S COLLEGE, Cambridge; OXFORD UNIVERSITY; WILLIAM OF

WYKEHAM; WINCHESTER. Consult Rashdall and Rait, *New College* (London, 1911).

NEWCOMB, nū'kom, SIMON (1835-1909). An American astronomer and mathematician, born at Wallace, Nova Scotia, March 12, 1835. He was educated first in his father's school and came to the United States in 1853. A year afterward he began teaching in Maryland and in 1857 was appointed computer on the *Nautical Almanac* at Cambridge. Graduating at the Lawrence Scientific School, Harvard, in 1858, he spent three years there in further study and was then appointed professor of mathematics in the United States navy. He negotiated the contract for, and supervised the construction of, the 26-inch equatorial telescope at the Naval Observatory. He was secretary of the Transit of Venus Commission in 1871-74, observed the transit of Venus at the Cape of Good Hope in 1882, and directed several eclipse expeditions, beginning in 1860. In 1877 Newcomb became senior professor in the navy and director of the *Nautical Almanac*, a position which he held till he was retired for age in 1897. He was also professor of mathematics in Johns Hopkins University in 1884-94 and for many years editor of the *American Journal of Mathematics*. Newcomb's labors in investigation were prodigious. He developed formulæ for the construction of accurate lunar tables and made measurements relating to the major planets, the larger asteroids, and the planetary satellites. His conclusions were notable for accuracy and often for boldness, and his memoirs for the vigor and clarity of their style. Abroad, besides holding membership in many scientific societies, he was made an associate of the Institute of France, the first native American since Franklin to be so honored, Commander of the Legion of Honor, and Knight of the Prussian Order "Pour le Mérite." Some idea of the diversity of his interests may be gained from the fact that Newcomb served as president of the American Association for the Advancement of Science (1877), the Society for Psychical Research (1885-86), the American Mathematical Society (1897-98), and the Astronomical and Astrophysical Society of America (1899, 1905); as vice president of the National Academy of Sciences (1883-89); and as president of the Congress of Arts and Sciences at the St Louis Exposition in 1904. He received the gold medal of the Royal Astronomical Society (1874), the Copley medal of the Royal Society (1890), and the first Bruce medal of the Astronomical Society of the Pacific, also numerous other distinctions at home and abroad, including degrees from 17 universities. Newcomb died at Washington, July 11, 1909, and received a military funeral, having been made rear admiral in 1906.

Among the more important of his 300-odd scientific memoirs, published mainly in the *Astronomical Papers of the American Ephemeris*, may be mentioned 'The Recurrence of Lunar Eclipses'; "A Transformation of Hansen's Lunar Theory"; "Development of the Perturbative Function and its Derivatives"; "On the Motion of Hyperion: A New Case in Celestial Mechanics." He also published: *Popular Astronomy* (1878), since translated into many foreign languages; *Astronomy for Schools and Colleges* (1880); with E. S. Holden, *Compendium of Spherical Astronomy* (1906); and numerous works of a similar character, on mathematics or astronomy, in general intended as

textbooks or for use by persons who desired comprehensive rather than detailed information. Much interested in economic questions, Newcomb wrote in this field. *A Critical Examination of our Financial Policy during the Southern Rebellion* (1865); *The A B C of Finance* (1877); *Principles of Political Economy* (1885); *A Plain Man's Talk on the Labor Question* (1886). He also wrote a novel, *His Wisdom the Defender* (1900). Consult his *Reminiscences of an Astronomer* (Boston, 1903) and Marcus Benjamin, in *Leading American Men of Science*, ed by D. S. Jordan (New York, 1910).

NEWCOMBE, FREDERICK CHARLES (1858-). An American botanist. He was born at Flint, Mich., and graduated from the universities of Michigan (S.B., 1890) and Leipzig (Ph.D., 1893). He taught in the Michigan School for the Deaf in 1880-87, and at the University of Michigan he was instructor in botany (1890-92), assistant professor (1893-97), junior professor (1897-1905), and thereafter professor. He was president of the Michigan Academy of Science and of the Botanists of the Central States in 1906.

NEWCOMBE MEMORIAL COLLEGE. See TULANE UNIVERSITY.

NEWCOMEN, nū-kōm'en, THOMAS (1663-1729). An English blacksmith, inventor of the atmospheric steam engine, considered the first combination of elements previously known into a true engine. He was born at Dartmouth and, it would seem, had addressed himself to the task of devising a practical engine before 1698, when Savery took out his patent. Possibly Newcomen had forged the larger parts of Savery's engine—they lived only 15 miles apart. But it is certain that Savery shared in the patent taken out by Newcomen about 1710. The part played by John Calley, who was more or less of a partner and assistant, is uncertain, probably he was a grazier who advanced Newcomen money. Newcomen's engine is described and pictured in a copper engraving dated 1719, it was a combination of preceding machines and an improvement on all of them, in that it was a complete change of type, the various elements of boiler, condenser, and engine pump being divided among so many separate parts, which, with the exception of the condenser (the present form of which is due to Watt), are essentially the same as those of the modern engine. Newcomen's was the first practical machine, and it was successfully and commonly used for pumping.

NEWCOMERSTOWN, nū-kūm'ēr-z-toun. A town in Tuscarawas Co., Ohio, 85 miles east-northeast of Columbus, on the Erie Canal and on the Pennsylvania Company and the Pittsburgh, Cincinnati, Chicago, and St. Louis railroads (Map: Ohio, H 5). It contains Mulvane's Free Park. The chief industrial establishments are pipe works, a file factory, clay works, and manufactories of brass and bricks. Coal and clay are found in the vicinity. Pop., 1900, 2659; 1910, 2943.

NEWCOMES, nū'komz, THE. A novel by W. M. Thackeray (1854-55). The character of Colonel Newcome is one of the finest delineations of a simple-minded, pure-hearted gentleman in fiction, and is said to have been drawn from the author's stepfather, Colonel Smyth.

NEW CONNECTION METHODISTS. See METHODISM.

NEW CONNECTION OF GENERAL BAPTISTS. See BAPTISTS.

NEW CORINTH. See CORINTH.

NEW CUMBERLAND. A town and the county seat of Hancock Co., W. Va., 34 miles by rail north of Wheeling, on the Ohio River and on the Pittsburgh, Cincinnati, Chicago, and St. Louis Railroad (Map: West Virginia, D 1). It is chiefly engaged in the manufacture of fire and paving brick, sewer pipe, glassware, foundry and machine-shop products, and tiling, the adjacent region having valuable clay deposits. There are also coal mines and mills for the pulverization of fire clay for use in iron-works. Pop., 1900, 2198, 1910, 1807.

NEW DECATUR, dē-kā'tūr. A city in Morgan Co., Ala., 81 miles north of Birmingham, on the Tennessee River, just above Decatur, and on the Louisville and Nashville Railroad (Map: Alabama, C 1). It is developing rapidly as an industrial centre, being noteworthy for iron manufactures. There are also important cottonseed-oil and lumber interests, railroad repair shops, and tanneries. New Decatur was settled in 1887 and was incorporated in 1889. Under a revised charter of 1899, the government is vested in a mayor, elected every two years, and a unicameral council. Pop., 1900, 4457; 1910, 6118.

NEWDIGATE, nū'di-gāt, SIR ROGER, fifth BARONET OF HAREFIELD AND ARBURY (1719-1806). An English patron of art and letters. He was educated at Westminster School and at University College, Oxford, served as a member of Parliament for Middlesex in 1741-47 and for Oxford in 1750-80, and was interested in collieries and in canal building. He made an extensive collection of ancient marbles, casts of statues, and vases. Two marble candelabra, found in Hadrian's Villa at Tivoli, were bought by Newdigate for £1800 and given to the Radcliffe Library, Oxford. In 1806 he established at Oxford the Newdigate prize of 21 guineas to encourage the writing of English verse.

NEW DONGOLA, dōn'gō-lā. A town of the Egyptian Sudan. See EL ORDEH.

NEWELL, nū'el, FREDERICK HAYNES (1862-). An American hydrographer and irrigation engineer, born at Bradford, Pa. He graduated from Massachusetts Institute of Technology in 1885, and was afterward assistant hydraulic engineer (1888-90) and hydrographer (1890-1902) of the United States Geological Survey, and then served as chief engineer (1902-07) and as director after 1907 of the Reclamation Service. Newell became a member of the Land and Inland Waterways commissions. In 1907 he was president of the Washington Society of Engineers. His publications include: *Hydrography of the Arid Regions* (1891); *Agriculture by Irrigation* (1894); *The Public Lands and Their Water Supply* (1895); *Irrigation in the United States* (1902; rev. ed., 1906); *Hawaii Its Natural Resources* (1909); *Principles of Irrigation Engineering* (1913).

NEWELL, PETER (SHEAF HERSEY) (1862-). An American illustrator and writer, born in McDonough Co., Ill. He worked for a time as photographer and maker of crayon portraits in Jacksonville, Ill., and later studied at the Art Students' League in New York City. Afterward he settled at Leonia, N. J., and contributed constantly to various current publications. His work in flat tones was a later development of his original talent, and became very popular through the ingenious *Topseys and Turveys* (1893-94); *A Shadow Shown* (1896);

Peter Newell's Pictures and Rhymes (1899); *The Hole Book* (1908), *Jungle Jangle* (1909), *The Slant Book* (1910); *The Rocket Book* (1912)—volumes for which he furnished the text himself, and which display a thoroughly original humor and much quaintness of drawing. He also produced the clever and grotesque illustrations for John Kendrick Bangs's *House-Boat on the Styx*, *Pursuit of the House-Boat*, and *Mr. Munchausen*; Lee's *Tommy Toddlers*; Stockton's *The Great Stone of Sardis*; Mark Twain's *Innocents Abroad*; and Lewis Carroll's *Alice in Wonderland* and *Through the Looking Glass*.

NEWELL, ROBERT HENRY (1836-1901). An American humorist, born in New York. His reputation was made during the Civil War by newspaper sketches and letters over the name Orpheus C. Kerr (Office Seeker). These letters were collected in four volumes (1862-68). Newell also wrote romances and several volumes of verse. His humor lightened the toil of Lincoln, and it was genuine though not excellent.

NEW ENGLAND. The collective name of the States of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut. It has an area of 67,384 square miles, and had a population, in 1910, of 6,552,681.

Leif Ericson is believed by many to have sailed along the coast of New England as early as 1000 A.D., and it is in New England that the mythical city, Norumbega (q.v.), is generally supposed to have been located. The coast seems to have been visited by Verrazano in 1524, and was to a considerable extent explored by Sir Humphrey Gilbert in 1583, by Gosnold in 1602, by Sir Martin Pring in 1603, and by George Weymouth in 1605. By the charter of 1606 the Plymouth Company was empowered to make settlements in what was then called North Virginia; but an attempt (1607), by a company under George Popham, to found a settlement on what is now the Maine coast, failed. In 1614 Capt. John Smith sailed along the coast, and also went for some distance inland up several of the rivers. He prepared a description of his voyage and a rough map of the coast, and suggested the name New England for the region. Beginning with 1620, when the Plymouth Colony was established in the present Massachusetts, settlers gradually came into New England, and in 1643 the colonies of Connecticut, New Haven, Massachusetts Bay, and Plymouth united to form a confederacy known as the United Colonies of New England, the first attempt at federation made in America. Each colony was to choose two commissioners, and the eight commissioners thus chosen were to hold annual sessions at Boston, Hartford, New Haven, and Plymouth, and were to take action with reference to various matters of common interest to the four colonies. In 1663 the meetings became triennial. Meetings were held as late as 1684, though in the last years little was accomplished. Of the present New England States, Connecticut resulted from the union of the colonies of Connecticut and New Haven, and Massachusetts from the union of the colonies of Massachusetts Bay and Plymouth; while both New Hampshire and Maine were originally under the jurisdiction of Massachusetts, Maine not receiving a separate organization until 1820. See articles on the States and UNITED STATES.

NEW ENGLAND HISTORIC-GENEALOGICAL SOCIETY, THE. An association

incorporated in 1845 in Boston, Mass., for historical research in regard to the family histories of the early settlers in New England and the collection of old records. The society began the collection of a library which now contains 40,000 volumes and as many pamphlets, and has also a collection of relics and curios, manuscripts, and many old portraits and oil paintings. It now has a membership of 1000, and holds monthly meetings. In 1847 the society began the publication of a quarterly magazine, the *New England Historical and Genealogical Register*, for circulation among its members, giving the proceedings and necrology of the society, and is now publishing *Vital Records of Massachusetts Towns* to 1850.

NEW ENGLAND ORDER OF PROTECTION. See PROTECTION, NEW ENGLAND ORDER OF.

NEW ENGLAND PRIMER, THE. One of the most famous schoolbooks in the history of education. Yet it is uncertain when it first appeared, and of the 2,000,000 copies that it is reasonable to suppose were printed and sold in the eighteenth century, less than 50 survive, representing, however, some 40 editions. Much has been done to clear up the bibliography of the work by Paul Leicester Ford in *The New England Primer: A History of its Origin and Development, with a Reprint of the Unique Copy of the Earliest Known Edition, and Many Facsimile Illustrations and Reproductions* (New York, 1897). The compiler of the work was shown by Ford to have been Benjamin Harris, an English printer and rhymester, who during the reign of James II came to Boston. Here some time before 1690 he first issued the *Primer*, an abridgment of another compilation, *The Protestant Tutor*. A fragment of this first edition, or of a second, soon after, was found used as waste in the binding of a book printed in 1688, and is known as "The Bradford Fragment." The *Primer* was changed from time to time to suit not only religious but political feeling. The most familiar quotation from the *New England Primer* is doubtless the nursery prayer, "Now I Lay me Down to Sleep." The *Primer* was "embellished" by crude cuts which have to-day an exceedingly quaint aspect. The composition of its different editions varies greatly. The earliest is thus made up: (1) Title, (2) Godly Admonitions, (3) Alphabet and Syllabary, (4) Rhymed Alphabet, (5) The Dutiful Child's Promises; (6) An Alphabet of Lessons, Texts of Scripture; (7) Choice Sentences; (8) The Lord's Prayer, Creed, and Ten Commandments; (9) The Duty of Children, Texts, (10) Hortatory Verses; (11) Names in Order of Biblical Books; (12) Roman and Arabic Numerals from 1 to 100; (13) John Rogers' Exhortation to his Children; (14) The Shorter Catechism. Some of the more noteworthy features of other editions are the following: John Cotton's "Spiritual Milk for American Babies," a still shorter catechism, and a "Dialogue between Christ, Youth, and the Devil." A reprint of the *Primer* (Albany, 1899) is easily accessible.

NEW ENGLAND THEOLOGY. The name given to a distinct school of Calvinistic theology, originating in New England, and characterized by modifications of the older theology in respect to the nature of God; the freedom, ability, and responsibility of man; the nature of moral action, and the constitutive principle of virtue.

The school arose in an effort to make of Calvinism "a theology that could be preached," and to ground doctrine upon reason. The originator of the school was Jonathan Edwards (q.v.) With Edwards and his immediate successors the general aim was to combat Arminianism. In 1770 John Murray (q.v.) arrived in New England and began to preach Universalism. (See UNIVERSALISM.) The early decades of the nineteenth century were occupied with the Unitarian controversy and with discussion of the teachings of Dr. Taylor, of New Haven, particularly concerning sin, depravity, and regeneration. The outcome was the adoption of the principles which have since been known as the New England theology, and which may be stated in the propositions that all sin is voluntary, that through the connection with Adam there is in man a sinful propensity which renders it certain that every man will sin from the beginning of moral action, that, though man has complete freedom of will, as a fact, he never turns to God without the previous regenerating operation of the Holy Spirit, which persuasively turns him to repentance and holiness, that holiness is disinterested love, that election is the choice, for reasons lying in the knowledge of God alone, of certain persons, without regard to their own merits, as the recipients of such gracious influence as shall certainly secure their repentance. During the past half century theological thought in New England, as elsewhere, has been profoundly influenced by German philosophy and historical criticism and by the theory of evolution. As a consequence the New England theology as a distinct school has be-

come a thing of the past, and the unmodified doctrines of the older leaders are no longer taught in the Congregational seminaries. Attention has passed from the subjects which this theology considered central. Among those prominent in developing and defending the teachings of the school, after Edwards (1703-58), may be mentioned: Joseph Bellamy (1719-90), Samuel Hopkins (1721-1803); Jonathan Edwards, the Younger (1745-1801); Stephen West (1735-1819), Samuel West (1730-1807); Nathaniel Emmons (1745-1801), Timothy Dwight (1752-1817); Nathaniel W. Taylor (1786-1858), Leonard Woods (1774-1854); Moses Stuart (1780-1852); Edwards A. Park (1808-1900), Henry B. Smith (1815-76), Horace Bushnell (1802-76); Samuel Harris (1814-99). Consult. Williston Walker, *History of the Congregational Churches in the United States* (New York, 1894), G. P. Fisher, *History of Christian Doctrine* (ib., 1896), G. N. Boardman, *History of New England Theology* (ib., 1899); F. H. Foster, *A Genetic History of the New England Theology* (Chicago, 1907). See also CONGREGATIONALISM, and the biographical notices of the leaders.

NEW FOREST. A forest region in the southwestern part of Hampshire, England, with an area of 92,365 acres (Map England, E 6). It dates from the Norman Conquest, when the district was afforested and protected by severe laws by William the Conqueror. It is a crown possession managed by the Court of Verderers as a public pleasure ground. It is a favorite resort of artists. Consult C. J. Cornish, *The New Forest* (London, 1905).
